His vast learning, which provided an important source for Byzantine scholars, may be discerned in the fragmentary remains of bulky commentaries on Homer and other philological works on Pindar and Thucydides and, not least, in a *Chronology* that was an important source for Christian writers in their attempts to prove the greater, or at least equal, antiquity of the Jewish, compared with the pagan, tradition. But Porphyry fell foul of the Christians with the publication of his treatise *Against the Christians*. The work proved so damaging that it was publicly condemned in a number of imperial edicts and was fated to survive in fragmentary form, ironically, in the works of Christian polemicists seeking to counter its claims (e.g. Eusebius of Caesarea). Although Porphyry attacked a number of Christian doctrines (the divinity of Christ, the resurrection of the body), he reserved his chief criticism for the worldly quarrelling of Christ's disciples, especially Peter and Paul, and their distortions of his teaching. Most serious of all, however, was his devastating and scholarly attack on the authority of scripture itself and particularly that of the book of Daniel, which he proved to have been written after the events it was claimed to have prophesied. Porphyry is commonly referred to by Christian writers as the enemy of Christianity and his name was effectively invoked against the Arians who were dubbed Porphyrians, probably because of their subordination of Christ to the Father.

Unlike Plotinus, Porphyry was deeply interested in religion, to which he devoted several large works including a collection of oracles, *Philosophy from Oracles*, in which he apparently explored the philosophical content of oracles mainly from oracular centres in Asia Minor (Didyma and Claros). The attempt to relate philosophy to religion was one of his abiding interests. Realizing that the philosophical road to what he called "salvation" was open only to the

few, he sought among the various religions (including Judaism) a common way of salvation open to all men. His failure to find such a way involved him in addressing serious questions about the assumptions of traditional religious practice and in expressing concern about its limited spiritual horizons. His *Letter to Anebo*, a probably fictitious Egyptian priest, raises these issues and was answered by Iamblichus in *On the Mysteries*, a work that can lay claim to being the first systematic attempt to grapple with the philosophy of religion. This work of Iamblichus was to be a momentous point in the reconciliation of pagan religious practice, particularly the salvific rites of theurgy, with philosophy. Iamblichus set the tone for Proclus who in this respect had a profound influence on pseudo-Dionysius and Michael Psellos, who tried to adapt his views to Christian sacramental theology. But, despite his more reserved views about such subjects as the effect of theurgic rites or the presence of the divine in statues, some of Porphyry's pious philosophical tracts survived as popular reading: for example, the *Letter to Marcella*, written to his wife, whom he married late in life, and in which he apologizes for an enforced absence with the explanation that physical separation means nothing to those whose true self is set at the level of "intellect" which is beyond all spatial restrictions; or *On Abstinence*, which advocates vegetarianism and a spiritualized religious practice. The charming essay *On the Cave of the Nymphs*, which presents a number of differing philosophical allegorical interpretations of Homer's depiction of the cave in which Odysseus hid his Phaeacian treasures (*Odyssey*, 13. 102–12), had an enduring influence as a model of Neoplatonic metaphysical allegory despite its unsystematic approach compared with the rigours of Proclus' method.

Biography

Born probably at Tyre in AD 234 with the Syrian name Malchas, Porphyry studied at Alexandria, at Athens under Longinus, and at Rome where he was a pupil of Plotinus. He wrote more than 70 works, of which few survive. He also edited the *Enneads* of Plotinus. His commentaries on Aristotle and Plato are much valued. He died c.305.

Writings

On Abstinence from Animal Food, translated by Thomas Taylor, edited by Esme Wynne-Tyson, London: Centaur Press, and New York: Barnes and Noble, 1965.

The Cave of the Nymphs in the Odyssey, Buffalo: Department of Classics, State University of New York at Buffalo, 1969.

Porphyry, the Phoenician Isagoge, translated by Edward W. Warren, Toronto: Pontifical Institute of Mediaeval Studies, 1975.

Portraiture

Realistic likenesses of individuals originated in the 4th century BC in Greece, although portrait prototypes had appeared two centuries earlier as dedication statues. An example of this type is the seated figure of *Chares* (British Museum, London), a hereditary priest from the temple of Apollo at Didyma. Similar categories of images from the later Archaic period are commemorations honouring victorious athletes, mainly at Olympia. In the 5th century BC the cult of the hero was prominent, but portrayals of athletes continued. There was a high degree of realism, although the works reflected an idealized picture of youth. Between 480 and 450 BC the practice of honouring the great citizens of Athens with portrait statues became acceptable, although only posthumously. During the Classical period images of military and political leaders, poets, and other heroic men were created so as to reflect their superhuman qualities.

With the end of the Peloponnesian War in the early 4th century BC a novel approach in rendering portraits evolved. Contemporary heroes and intellectuals were now honoured in public locations by private donors. A portrait of the philosopher Plato by the sculptor Silanion (Vatican Museum, Rome) was commissioned by a former student for the Academy in Athens. The sculpture is more of a mask, individual features that reveal nothing of the inner workings of the mind. Towards the middle of the 4th century BC, when the Greeks were encountering rising Macedonian power under Philip II, father of Alexander the Great, Lycurgus, appointed virtual dictator of Athens for 12 years, systematically commissioned a large number of public buildings decorated with portrait statues; he wished to revive the great heroes of the past as examples for modern Athenians to emulate. A large number of portraits were set up at public sites such as the theatre of Dionysus, where bronze statues of the great tragic playwrights Aeschylus, Sophocles, and Euripides were installed. The likenesses of these individuals have an added quality of character and personality that contrasts with the idealized and detached countenances of the 5th-century examples. As full-length statues, their gestures and pose were as important as the features, reminding viewers of their personality, character, and physique. Such statues were frequently inscribed with the subject's name, but rarely with the

sculptor's. Portraits of women were rare before this time and restricted to generic statues of maidens, or as female types engaged in everyday activities on vase paintings. An exception to this trend is a portrait of an elderly priestess of Athena by the sculptor Demetrius who specialized in depicting elderly people.

In the last third of the 4th century BC Alexander the Great chose Lysippus as the official sculptor for his court portraits. The heroic ideal of the beardless young general became a standard mode of representation for the Macedonian king. The famous mosaic of *Alexander the Great and Darius* at the Battle of Issus (Museo Archeologico Nazionale, Naples) is a Roman copy of a Hellenistic painting probably painted in Egypt, perhaps by Helen, who trained under her father Philoxenos, in the 4th century BC. It is also known that Alexander commissioned the great painter Apelles and the gem engraver Pyrogoteles to portray him, in addition to the sculpted likenesses by Lysippus. Despite literary descriptions of the beautiful young general, no great images remain for posterity.

Subsequent Hellenistic rulers emulated this portrait type but eventually added their own distinctive style and individual characteristics to the mass-produced likenesses. The most significant change in the portrait tradition reflected the philosophical changes that had taken place. Aristotle, teacher of Alexander, identified men according to personality rather than classifying them according to their occupation, the practice of the 5th century BC. In sculptural portraits, therefore, there was a marked change from emphasizing external features to showing the characteristics that mirrored the psyche of the individual and reflected his or her inner life. Changing attitudes towards the physical and spiritual world are identified in the portrait of *Aristotle* commissioned by Alexander. The new biographical portrait encompassed the entire life of the individual and, as such, became a milestone in the development of the history of portraiture and art in the western world.

The portraits of Alexander's successors are more individualized, with the three major kingdoms in Egypt, Syria, and Asia Minor assimilating distinctive artistic traditions. General categories of portraits still persisted, that of the ruler and the intellectual. A desire to portray strong emotions resulted in a new emphasis in portrait-making that emphasized a kind of hyper-realism in depicting anti-heroic types. Drunken old women, defeated boxers, dancing dwarves, emaciated men, and languid lovers all promoted art and its spread, not only in public places of gathering, but at a popular level. Because of the vast numbers of portraits produced, there is ample evidence for multiculturalism and diversity in the ancient Greek world, shedding light on ordinary people as well as the aristocracy. With the Roman

conquest of Greece, the changing tradition of creating and commissioning portraits of private citizens as well as public heroes was an important artistic and philosophical legacy passed on to Rome by the Greeks. Unfortunately, surviving painted portraits and likenesses created in mosaic are rare in the Greek world. As a result of the eruption of Mount Vesuvius in AD 79, however, several personalities have been brought to light by archaeological discoveries at Pompeii, Herculaneum, and Stabiae. A 25 × 20 cm mosaic of an unidentified Pompeian woman of the 1st century BC (Museo Nazionale, Naples) reflects the psychological portrait type popular in the Hellenistic era. Her likeness is formed with very small pieces of coloured stone, called tesserae, in a manner that mimics the subtle shading of the facial features. Likewise, the double portrait of a man and his wife (Museo Nazionale, Naples), discovered next door to a bakery in Pompeii, is painted with the cultural symbols of the middle class. He is holding a scroll and his wife, in her red-dyed robe, holds a wax tablet and stylus, perhaps for the accounts. For the merchant classes, it was important to show one's occupation and status in addition to a rather naturalistically rendered likeness.

In Egypt the painters of the Fayum were either Greek residents dating from the Ptolemaic period of the late 4th century BC, or those who had inherited the Greek artistic tradition. The art school established at Alexandria was an extension of Graeco-Macedonian art, a tradition that melded with the Egyptian manner of creating body doubles to which the spirit of the deceased could return. Culture was much the same under the Romans as it had been under the Hellenistic rulers, with the chain of artistic knowledge remaining unbroken for many years. The Fayum portraits bridged the gap between Hellenistic portraits and the abstract likenesses of Byzantine icons.

The wax portraits completed during the life of the individual and displayed in the home belonged to the traditions of Greek art. After death, the portrait panel was placed over the Egyptian mummy's face. Gold wreaths, jewellery, and hair ornaments were painted on, contrasting with the impressionistic quality of the portrait. What is unique about the Fayum portraits is the way in which the personality is reflected through the faces of men and women in a psychologically compelling way. The Christian emphasis on the spirit with the body as a vehicle for the soul found a parallel in the Fayum portraits, particularly the eyes, which convey spirituality; they were the ideal stepping stone for the transition from painted portrait to icon. Portraits underwent a series of transformations from idealized image to the abstracted faces of Byzantine emperors and members of their court, which were represented in paintings, mosaics, coins, and jewellery.

Posidonius c.135^{BC}–c.51^{BC}

Philosopher and scientist

To call Posidonius a “historian” would be unduly reductive. Posidonius was a Stoic philosopher and a scientist, with a wide worldview that integrated cosmic, natural, and human phenomena. More than 400 testimonia and fragments testify to his contribution to knowledge, which ranges from mathematics, astronomy, and geology, to ethics, anthropology, and history. He meditated on the universe, seen by him as an animated organism, and on its generation and destruction. He studied the solar system, envisaged a lunar theory to explain the periodicity of tides and a new method of measuring the circumference of the earth, suggested “ethnic criteria” for naming the earth zones, and outlined a history of the circumnavigation of Africa. In human sciences his curiosity was stimulated mainly by customs, an essential element of what he called “ethology” (fragment 176 in the Edelstein-Kidd edition, E-K), i.e. character formation and characterization of people. He might he defined as a “primitivist” who idealizes the primeval stages of mankind as a golden age; but he was convinced that the ascent of man from barbarism to civilization was determined ultimately by “wise men” – legislators, inventors, imitators, or importers of foreign arts and techniques (testimonium 6; fragments 265–67 in the Jacoby edition; fr. 284 E-K) – as if there was an element of “progress” in his thought. Undoubtedly, he admired the presumed simplicity of “noble savages” and had no praise for the luxury and extravagances prevailing in his time either in decadent cities and royal courts (especially in the east: e.g. fr. 56, 58, 61a, 65,

77 E-K) or among the ruling elites of tribal societies (fr. 67, 152 in the Theiler edition, D-F). He eulogized the presumed virtues, frugality, justice, and religious devotion of the ancient Romans (fr. 256–61 and 265–67 E-K, with the exempla of Brutus, Marcellus, and Scipio), as against the current intemperance and corruption. Following Polybius, he probably looked at the crucial year of 146 BC as the completion of Roman imperialism and the beginning of its moral decline. Like Polybius, he was a Greek thinker who tried to explain the merits of Roman rule to his fellow countrymen and to persuade them to accept it, at the same time doing his best to persuade the Roman ruling class to behave in a way that was attractive to most of the subject peoples. He fully justified imperial rule, even the exaction of tribute by more intelligent nations, in return for protection and security for the weak, on the model of the relationship between the Pontic Heracleotes and the Mariandynians, who were allegedly reduced to serfdom by consent (fr. 60 E-K). He believed that riches spur men to do evil, and was ready even to acknowledge that tyrannical rule may provoke rebellions; yet he never justified revolts and described vividly the immoral and extravagant behaviour of rebel leaders (e.g. Athenion, tyrant of Athens: fr. 253 E-K; Demophilus, the leader of the rebel slaves in Sicily: fr. 59 E-K). In the light of such views it is not easy to decide whether Posidonius sided with the Roman Optimates or with the Populares. His romantic view of the past invites comparison with the Gracchan tradition, but unlike it, his conservatism was definitely anti-revolutionary (fr. 51 E-K; cf. Jacoby, fr. 87, 110–12).

Posidonius' direct predecessors were Panaetius and Polybius, the first as his Stoic teacher, the second as chosen universal historian to continue his work. Yet Posidonius was not dogmatic, and continuation did not imply identification with the views and methods of his predecessor. He criticized Chrysippus (fr. 34 E-K), the grand master of 3rd-century Stoicism, and attacked Polybius for his biased report of Tiberius Gracchus' activities in Spain (fr. 271 E-K). In sciences and philosophy he used Plato extensively, and Aristotle, and occasionally many others, for example, the "astrologer" Bion (a disciple of Democritus), the philosopher Crates, the historian Callisthenes, the peripatetic statesman Demetrius of Phaleron, and the geographer Timosthenes. In ethnography Posidonius was comparative and moralistic in spirit. He valued autopsy no less than Herodotus, whom he mentions together with Heraclides Ponticus on the circumnavigation of Africa, and shared with him the main didactic purpose of pointing out the contrast between *Naturvölker* and civilization. An oriental Greek like Herodotus, Posidonius was no less inclined to ascribe to ancient eastern sages discoveries conventionally attributed to later Greek scientists – for example, the atomic theory,

invented according to Posidonius not by Democritus of Abdera but by the Phoenician Mochos of Sidon before the Trojan War (fr. 286 E-K). In his repetitive descriptions of luxury banquets and receptions, drinking habits, etc., Posidonius echoes the Hellenistic motif of trust, best represented before him by Phylarchus of Athens and Agatharcides of Cnidus. He also probably used Ephorus, Polybius' main predecessor in universal history, and Timaeus; and he knew of Eudoxus of Cnidus' observation of Canopus when making his own (fr. 204 E-K). Finally, Artemidorus of Ephesus, who travelled in Gaul and Spain around 100 BC, was known to Posidonius, who occasionally disagreed with him (Jacoby, fr. 119, 223).

Posidonius was unquestionably the greatest Stoic philosopher of his age. Among his closest friends and admirers were some prominent Romans, such as Rutilius Rufus, Cicero, and Pompey, and his prestige in Latin literature is well attested (e.g. in Vitruvius, Seneca, Pliny, Quintilian, Tertullian, Lactantius, St Augustine, Macrobius, and Boethius). The Hellenic tradition starts with his disciple Jason, who succeeded him at Rhodes, and with Diodorus Siculus, who used Posidonius (with other sources) on the period covered by his *Events after Polybius* (146–c.86 BC). Posidonius' influence as an intellectual must have been extensive in his generation, but he soon began to be consulted, quoted, and at times criticized by scientists and philosophers mainly for specific points of their interest. Thus, for instance, his disciple Geminus, an astronomer, compiled an “epitome” of, or a commentary on, his *Meteorologica* (t 42, 72 E-K), and the philosopher Arius Didymus included in his doxography Posidonius' definitions of cause, substance, and matter, origin, destruction, and so on. Strabo, a great admirer of Posidonius, made full use of his geographic works, though criticizing his “aetiology” (“precisely what our school [i.e. the Stoic] avoids”) and his rhetorical style (fr. 239 E-K).

Plutarch quotes Posidonius both on scientific and moral issues in the *Moralia* (and in his *Lives* of great Romans (Marcellus, Fabius Maximus, Marius, Cicero, Pompey, and Brutus). Galen used Posidonius extensively but critically, especially on ethics; Athenaeus, our main authority on Posidonius' historical works, aptly understands the relationship between his ethnography and his Stoicism; and Diogenes Laertius quotes his views on many topics, especially in book 7 (on the Stoics). Among later readers the most prominent is perhaps Cleomedes (now dated to the 4th century AD), who was interested in astronomy and physics. The *Suda* has an entry on Posidonius, and in the 12th century Eustathios made full use of his scientific and ethnological work in his commentaries on Homer and Dionysius Periegetes.

Surprisingly enough for a man of such reputation, with nearly 70

recorders, none of Posidonius' 30 or so works has reached us in its entirety. But perhaps modern evaluations of his achievements have been too high. The claims that in the history of ancient thought Posidonius can be compared to no one but Aristotle, or that he was the most important critic and philosopher of culture in the ancient world, are patent and unwarranted exaggerations, partly resting on questionable reconstructions of Posidonius' thought allegedly retrievable from later authors supposed to be his followers or even his plagiarists. At any rate, in the Hellenic tradition of Roman and Byzantine times Posidonius' place seems assured among the great thinkers of second rank – still a very high station.

DAVID ASHERI

Biography

Born at Apamea in Syria c.135 BC, Posidonius was educated in Athens under Panaetius but lived mostly in Rhodes. He participated in an embassy to Rome in 87/86 BC and travelled extensively in the west. His school in Rhodes was a centre for Stoicism. He wrote on a wide range of subjects including science, mathematics, geography, and history as well as philosophy. He died c.51 BC.

Pottery

The introduction of pottery vessels is one of the defining features of the Neolithic period (c.7000 BC). Although at this time it was handmade, some Greek Neolithic pottery reached high standards of fabric, form, and decoration, the last mostly in geometric patterns. The products of the Neolithic cultures of Thessaly (Sesklo, Dimini) are particularly noteworthy.

There was only limited continuity of features into the Early Bronze Age (c.3500 BC), when quite different types appeared and some early influence was exerted by Anatolian forms. The most interesting innovations are found in Crete (Vasiliki "teapots", the mottled colouring produced by manipulating the firing process) and the Cyclades (incised "frying pans" with representational motifs; painted patterns).

The Middle Bronze Age saw the rise of the Cretan palaces (c.2000 BC), the first widespread use of the wheel for pottery-making, and highly sophisticated ceramics. Some Cretan wares were extremely fine ("eggshell") and motifs, in the "light-on-dark" technique characteristic of the time, were subtly accommodated to the shapes. Potters on the mainland had some distinctive fabrics (Minyan, Matt-painted ware) but less decorative imagination, while Cycladic craftsmen derived their inspiration from Crete, at the same time showing individual enterprise in the development of shapes (panelled cup) and motifs (goblets).

The Late Bronze Age (c.1600 BC) was dominated, both politically and culturally, first by the later Cretan palaces, then by the Mycenaeans of the Greek mainland. In Crete a new system of decoration ("dark-on-light") succeeded, and was used at first for a combination of geometric motifs (spirals) and floral and grass designs, then also for a highly distinctive "marine" style. The Mycenaeans inherited all these features but imbued the pottery and other products of their material culture with distinctive stylistic and thematic features. In particular they simplified and stylized the decorative elements, which in Crete had been relatively naturalistic, to a high degree. Some shapes are also distinctive of their taste (*kylikes*, or high-stemmed goblets; deep

bowls). A “pictorial style”, the motifs of which are mainly birds, animals, and warriors in chariots, was less widespread. In the last phase of the Bronze Age (12th and early 11th centuries BC) a pictorial strain continued (including the new “Octopus style” of the Aegean) but pottery subsided into a more limited range of shapes with little or no decoration. In the sub-Mycenaean phase (mid-11th century BC) the pottery produced was poor in quality and restricted in variety.

Although little Cretan pottery was exported beyond the Aegean in the Palace periods, within that area it was strongly influential. Mycenaean products reached a much wider audience – Cyprus (for which market much of the pictorial style was manufactured), the Near East, Egypt, southern Italy, and Sardinia. Philistine pottery of a late phase of the Bronze Age is derived from Mycenaean.

During the Protogeometric period (c.1025–900 BC) there was a great revival of quality, if not range, with new taut shapes and precise, often compass-drawn motifs, and craftsmen showed a fine sensitivity for the harmonizing the two. This characteristic quality continued to prevail in the subsequent Geometric period, when zones of decoration tended to multiply until they covered the whole surface of the vase. Schematic figures, geometric in character, also appeared, and some of the scenes in which they were shown may be the earliest pictorial versions of Greek myths. The largest vases (c.1.5 m high) were used as grave markers, and mourning and funerary scenes are common.

The Geometric style lasted to c.725 BC and beyond, but, in its later stages, enlargement of and greater concentration on the figured scenes brought a decline in the relationship of decoration to shape. This trend was partly due to the increasing interest of Greek vase painters in the arts of the east Mediterranean, where a fuller and non-geometric treatment of the human form was current (although not in pottery decoration). “Orientalizing” features (c.725–625 BC) are most evident in the adoption and treatment of bird and animal motifs.

Corinth was the most innovative centre at the time, and a new technique was introduced there c.700 BC. This was the so-called “black figure” method, which involved painting the figures in a clay slip (the black colour was achieved by the firing process) on the vase surface and incising details of anatomy, drapery, etc. with a sharp point; other colours were sometimes added. The precision of this method suited the fine detail required for the decoration of the tiny perfume flasks (*aryballoi*) which were the staple of the Corinthian industry.

The Athenians, with a preference for larger vases, initially drew their figures in outline, painting in the detail, but around 625 they too adopted the black-figure technique and used it increasingly for large-scale mythological scenes. Their pottery rapidly superseded that of Corinth in popularity. The stately magnificence of the work of the best

Athenian black-figure painters (such as Execias and the Amasis Painter) of the mid-6th century BC is astonishing. Interest continued to be focused on the figured scenes (see below), although the elegance and symmetry of the shapes and the surface finish were also of excellent quality. Black-figure pottery was widely exported, especially to the Greek colonies, and regional styles developed, in the case of the Etruscans even outside the Greek-speaking world.

Around 530 BC another new technique ("red-figure") was introduced and gradually became dominant. The vase surface itself was now covered with paint, the figures being left "reserved" to take on the natural colour of the clay when fired. Interior details were painted. The more natural body colour, and the greater fluidity that the painted line gave to dress and anatomy, allowed artists to depict more complex scenes in a more naturalistic way, but the otherworldly quality of black-figure was lost. During this period the art of wall painting was becoming prominent in Greece and there is good reason for thinking that vase painters adopted on occasion certain features (variable ground lines, landscape and background elements) that were better suited to the broad sweep of large panel pictures than to vase decoration.

Although there is no convincing explanation why pottery decorated with figured scenes in the red-figure technique ceased to be produced much after c.300 BC, it may be that the aesthetic effect had become much less satisfying, now that the importance of the relationship between shape and decoration had been forgotten in the quest for exciting narrative and spectacular effects, and borrowings from the world of free painting had proved counterproductive. Red figures were also less appropriate for vase decoration than black since, while the latter stay visually on the surface of the vessel and emphasize its volume and structure, the former seem to recede into the shape and deny its solidity.

From the time when the Greeks started to establish colonies and trading centres overseas (as early as the 8th century BC, but more intensively from the later 7th century BC), especially in south Italy and Sicily but also in other areas (the north Aegean, the Black Sea, Asia Minor), their pottery became more widely distributed, more influential on other cultures, and, in theory at least, more open to modification by the adoption of foreign ideas. In fact the influence of Greek pottery on that of other traditions was strictly limited (Etruscan vases are a marked exception) and the Greeks, whether at home or abroad, seem to have adopted little directly (the rhyton shape is one example) apart from a few superficial features, although exotic stylistic features were transformed into local idioms in the Orientalizing period. In particular, the black- and red-figure styles that

are so admired today had no further influence until the Neoclassical movement of the 18th century (see below).

Although the red-figure style lasted longer (till the early 3rd century BC) in the Greek colonies of south Italy, in the Hellenistic period it was superseded by other forms of decoration. Painted figured scenes were less prominent, but minor decorative elements were applied in this way (West Slope ware). Figures were now depicted in relief on vases made in moulds (Megarian bowls). The tradition of relief decoration continued in the most widely known varieties of Roman figured pottery (Arretine and Terra Sigillata, the latter sometimes known as "Samian", although it has no significant connection with the island of Samos). Many Roman shapes were also inherited from the Hellenistic world.

Greece, as part of the Roman empire, succumbed to Roman forms in the field of pottery and, if the Hellenistic influences are discounted, the products of this period are Greek only in the sense that they were manufactured in the Aegean, where some local variants of more widespread types naturally appeared. Only relatively recently has serious scholarly attention begun to be focused on pottery of the late Roman and subsequent periods.

Praxiteles

Sculptor of the 4th century BC

Praxiteles was an Athenian sculptor active in the 4th century BC; Pliny (*Naturalis Historia*, 34.50) places him in the 104th Olympiad (364–361 BC). It is likely that he came from a family of sculptors; his father was probably Cephisodotus, who created a famous statue of *Peace* (perhaps dedicated after 374 BC when Athens came to terms with Sparta). Praxiteles is likely to have been born around 400 BC and had probably died before 326 BC, when his son is known to have been responsible for naval liturgies at Athens. He was celebrated in antiquity, along with Lysippus, for achieving “realism” (Quintilian, *Institutio Oratoria*, 12.10.1–10).

Praxiteles made statues in both bronze and marble, and was, according to Pliny (*Naturalis Historia*, 34. 69), “more successful” in the latter medium. Marble was the medium used for his most celebrated statue, the *Cnidian Aphrodite*, which in Pliny’s day attracted people to the city of Cnidus (*Naturalis Historia*, 36. 20). Praxiteles had apparently been commissioned by the people of Cos to make a statue of Aphrodite, and he created two, one draped, and the other naked. The people of Cos rejected the former, while the naked statue was acquired by Cnidus and displayed in a circular temple so that the goddess could be viewed from all sides. One of the best descriptions was made by Lucian of Samosata (*Amores*, 13–14) in the 2nd century AD, who described it as “an exceedingly beautiful work of Parian marble”. The original is likely to have had parts that were gilded or painted to enhance the work. There was a tradition that Praxiteles used his mistress, Phryne, as the model for the statue. Roman copies of a naked Aphrodite, clearly just concluding a wash, are thought to be representations of this work. The original was carried off to Constantinople where, according to the Byzantine chronicler George Kedrenos, it was displayed in the basilica of Lausus – along with many other statues of the ancient world including the chryselephantine cult statue of *Zeus* from Olympia – until its destruction in a fire in AD 476.

Praxiteles also made a comparable *Aphrodite* in bronze. This was carried off to Rome and was subsequently destroyed in a fire that consumed the temple of Felicitas where it was displayed. Praxiteles’ continuing popularity in the Roman period is reflected by the way that his works were carried off to Rome. These were displayed in the gardens of Servilius, on the Capitoline, and in the collection of Asinius Pollio. Praxiteles’ fame led him to be associated with the creation of the Mausoleum of Halicarnassus, one of the wonders of the ancient

world.

Phryne was celebrated in a gold statue made by Praxiteles at Delphi (Athenaeus, 13. 591b). Phryne herself came from Thespieae in Boeotia, and it was there that Praxiteles made a marble statue of *Eros*; Strabo records the tradition that Praxiteles had given it to his mistress as a gift. This statue was removed by the Roman emperor Caligula, returned by Claudius, and then snatched by Nero; in Pliny's day it was displayed in the lecture rooms of Octavia in Rome. Pausanias, writing in the 2nd century AD (9. 27. 3–5), recorded that, although the original had been destroyed by fire in AD 80, a copy of Praxiteles' work made by Menodorus of Athens could still be seen at Thespieae.

At Olympia Pausanias (5. 17. 3) saw a marble *Hermes* carrying the infant Dionysus in the temple of Hera that was attributed to Praxiteles. A *Hermes* was in fact discovered in the temple in 1877 and was accepted as Praxiteles' original until questioned in 1927. Although there is a possibility that it is an original that was touched up by later sculptors, scholars now tend towards the view that the Olympia piece – perhaps the one seen by Pausanias – is in fact a work of the Hellenistic period, either by a member of Praxiteles' school or by somebody working in his style.

Pausanias (8. 9. 1) also recorded statues of *Apollo*, *Leto*, and *Artemis* in the temple of Leto at Mantinea. Although these statues have not survived, the base showing the *Muses* and *Marsyas*, mentioned by Pausanias, is preserved. These statues were dated to “the third generation after Alcamenes” who was active, according to Pliny (*Naturalis Historia*, 34. 49), in the 83rd Olympiad (448–445 BC).

Another of Praxiteles' works known from later Roman copies as well as representations on Roman coins is the *Apollo Sauroctonus* (“Lizard Killer”). This statue was described by Pliny as showing a young Apollo waiting to kill a lizard with an arrow. Altogether almost 70 works have been associated with Praxiteles, though some may be the works of members of his school or workshop.

Praxiteles' sons Cephisodotus (probably named after his grandfather) and Timarchus were also sculptors. Pliny (*Naturalis Historia*, 34. 51) places their activity in the 121st Olympiad (296–293 BC), although an inscription from a statue base shows Cephisodotus II was active in the year 344/43 BC (because it names the priest of Asclepius for that year). Further generations of sculptors can be traced into the Roman period.

Summary

Born probably c.400 BC Praxiteles was the son of Cephisodotus of

Athens, himself a sculptor, and was active c.375–330 BC. He worked in bronze and marble and specialized in portraits, notably of gods. No surviving statues can be attributed with certainty to him, though several are ascribed to his school. His sons Cephisodotus and Timarchus were also sculptors. He died c.326 BC.

Prehistory

Prehistory is the term used to describe societies which did not have written records. In Greek archaeology the term is sometimes used to include the Bronze Age, but more frequently (as here) it refers to the three periods of the Stone Age: Palaeolithic, Mesolithic, and Neolithic.

Because of its geographical position between Africa, Asia, and Europe, Greece is an area of great significance for the study of the movement of the earliest human groups between these areas, yet the discovery of the Greek Palaeolithic is very recent, dating from the late 1950s and early 1960s, when the first finds of stone tools were made in Thessaly and Epirus. The earliest and most important discovery to date is the human skull found in 1960 in the cave of Petralona, 75 km northeast of Thessalonica. The skull, which was initially thought to be that of a Neanderthal man (who lived in the middle Palaeolithic period) is now believed to belong to an archaic *Homo sapiens* (a more advanced, though earlier human being than Neanderthal) and to be at least 200,000 years old, much older than any of the stone tools found on Palaeolithic sites in Greece.

The earliest stone tools recovered from excavations and surveys are 50,000–30,000 years old and belong to the Leval-lois-Mousterian industry characteristic of the middle Palaeolithic. This industry, which is characterized by bifacial leaf points, is generally associated with Neanderthal man, who probably penetrated into northern Greece from central and southeastern Europe after the beginning of the last glaciation (a Neanderthal skull has been reported from the Mani peninsula in the Peloponnese). During the glacial periods northern Greece was positioned between the extremes of cold in the north and aridity in the south, and because it may have supported larger pockets of tree cover than areas further south, it was a favourable habitat for animals, and hence for hunter-gatherers. The groups which populated northern Greece are believed to have been small (about 25 people on average), and an extensive area such as Epirus may have had a total population of no more than 50 people at any one time.

In Epirus investigations in rock shelters (Asprochaliko, Kastritsa, Klithi) and open sites (Kokkinopilos and Grava on Corfu, which would have been attached to the mainland at the time) have yielded substantial quantities of middle and late Palaeolithic flint tools, animal bones (particularly of red deer and caprines), fish bones, sea molluscs, and plant foods. Research carried out by British archaeologists has highlighted the importance of the environmental setting of sites, such as their altitude and orientation. The use of the different sites by the highly mobile hunter-gatherer groups would have been conditioned by the time of the year, which affected the seasonal movement of animals, and by the specialized function of any one site. Subsistence strategies would have changed over time, following climatic and environmental changes. Conditions were at their most unfavourable during the glacial maximum (c.18,000 BC), but gradually gave way to a warmer, wetter climate, leading to the spread of deciduous forests and the downcutting of rivers around 10,000 BC.

In Thessaly middle and late Palaeolithic tools and fossilized animal bones were found on the banks of the Peneus river, while caves appear to have remained uninhabited. In the Peloponnese the most important upper Palaeolithic site is the large cave of Franchthi, where occupation started about 20,000 BC and continued into the Mesolithic and Neolithic periods.

The Mesolithic (8th millennium BC) is a period of change, which is particularly noticeable in the greater dependence on seafood, but in Greece sites dating from this period are very rare, probably because many were coastal sites and may have been swamped by the rising sea levels in later periods. At Franchthi the range of plant foods (nuts, legumes, and, for the first time, cereals) suggests a year-round occupation of the cave. The sea was the most critical resource for the

provision of food, and for communications, as shown by the presence in the cave of obsidian from Melos. The earliest burials in Greece are also found in the cave in this period.

The momentous change to a subsistence economy based on agriculture and animal herding and the birth of the farming village in Greece date from the 7th millennium BC, in Thessaly, the Argolid (Franchthi cave), and Crete (Knossos). Except for Franchthi, the earliest Neolithic sites had not previously been occupied (Crete had not been occupied at all), and because the animal and plant species used by the earliest farmers were not indigenous to these areas, it seems likely that the settlers came from lands where farming was already established, most probably Anatolia, sailing across the sea with the first domesticated animals and seeds on board their boats. Some pioneering explorations must have been carried out prior to full settlement, as the farmers seem to have identified advantageous environments for farming. The major areas of occupation and subsequent expansion were in Thessaly, particularly the Larissa basin, and they attracted settlement because of their good arable soil and possibly the natural irrigation system, through river valleys and flood plains, which prevailed at the time.

The Greek Neolithic (7th–4th millennia BC) is divided into early Neolithic, middle Neolithic, and late Neolithic. Between the early and late Neolithic settlement expanded steadily and increased in density. It was particularly successful in Thessaly; just over 100 sites were established in the Larissa basin in the course of the 1000-year duration of the early neolithic, and the number had increased to 150 by the end of the late Neolithic. Some sites did not survive from one phase to the next, but several new ones were founded in their place. All areas of mainland Greece, including Macedonia and central and southern Greece, were occupied by the end of the early neolithic, and island settlement, previously confined to Crete, Alonisos, Corfu and Antiparos (Saliagos), increased during the late Neolithic to include Aegina, Ceos, Mykonos, and Naxos. Although it has been suggested that successive waves of farmers arrived from the east throughout the Neolithic, it is more likely that the initial influx of people into the area was not followed by any equally significant number of immigrants.

The characteristic site in this period is the farming village, situated on a ridge or knoll and numbering a few hundred inhabitants. The dwellings were initially flimsy, but by the middle Neolithic the prevailing building type was a structure which, although only one storey high, could be fairly large, had a stone foundation, a superstructure of mudbrick or *pisé* (layers of clay) faced with plaster, and a flat or pitched roof of wattle and daub. Buildings with a megaron plan (rectangular with two rooms of uneven size) make their

appearance in Thessaly (Otzaki, Sesklo) in the middle Neolithic.

The main means of subsistence was the cultivation of plant foods: cereal (wheat, barley, millet) and pulses (lentils, peas, vetch). Of less importance was the herding of domesticated animals; sheep and goats predominate on excavated sites, with pigs and cattle in smaller numbers. Fish or game could play a supplementary role in the diet depending on the location of the settlement. Neolithic society is largely believed to have been egalitarian, with the whole community involved in food production. A move towards social differentiation may have taken place in the late Neolithic with the establishment of settlements on marginal lands.

Among the crafts, pottery making was the single most important innovation of the period. For a time the farmers of the earliest villages did not produce ceramic vessels (the phase is known as the preceramic Neolithic), but made extensive use of perishable materials such as wickerwork, matting, wood, and hide. Once introduced, pottery reached very high artistic and technical standards, though the potter's wheel was still unknown, and it was made in a considerable variety of styles; the surfaces were painted in one or more colours (polychrome), were impressed or incised, and the patterns were mostly geometrical (chevrons, triangles, spirals, etc.). There are both chronological and regional differences between the styles. Much of the fine decorated pottery must have been non-utilitarian. Tools were made of bone and stone (both polished and chipped), as were beads, pendants, and other ornaments.

Clay figurines are among the most attractive artifacts of Neolithic Greece. The largest group consists of steatopygic female figurines of different types, but there are also seated male figurines, and models of houses and furniture. Once thought to be fertility goddesses, the steatopygic figurines are today believed to have had a variety of functions, as their use for one specific cult cannot be inferred from their contexts in graves and houses. Ritual was an important element in the life of Neolithic communities. Although no structures have been unequivocally connected with ritual ceremonies, these may have taken place in open spaces, as in other cultures. The nature of Neolithic religion is unknown. Suggestions have been made that it was an "animistic religion" and, if so, the figurines may represent the spirits of ancestors.

The Neolithic was a period of increased communications, by sea as well as land. Similarities between pottery styles and the movement of materials from one area to the other reveal contacts between settlements and regions. The most frequently imported material, and one which travelled in great quantities over great distances, was obsidian from Melos, out of which the sharpest cutting tools were

made.

The greatest strides in the study of Greek prehistory have taken place in the last decades. New sites are being discovered with every new survey, and ongoing research is taking place into artefacts, as well as other areas relevant to the understanding of prehistoric man: strategies of exploitation of the environment, transmission of agricultural economy, seafaring, and human colonization of the islands. Progress has been made through the use of scientific techniques for dating deposits and sites, and for reconstructing the palaeoenvironment, but there is much scope for work leading to a better knowledge of important environment aspects, such the configuration of the Greek shoreline, particularly during the Palaeolithic, and changes in climatic conditions and vegetation cover. More accurate dating of neolithic sites would lead to a better understanding of the divisions between periods, and of the correlations between the different local cultures and assemblages during the period.

In modern Greece the Neolithic period arouses a fair amount of interest, among both archaeologists and the general public. It is regarded as the period when many of the “good things” in our modern civilization first appeared, including art, religious thought, and above all farming and the village way of life, both of which have remained fundamentals of Greek life to this very day. Moreover, figurative art appears for the first time in this period, as do other more specially “Greek” forms, like the meagron building plan. By contrast, the study of the Palaeolithic (and the Mesolithic) has yet to be assigned the position and given the support it enjoys in other countries. That it has not achieved such status may be due not only to the fact it is still in its infancy or to the more impressive character of the products of later Greek cultures, but also to the fact that the achievements of man in this period are seen as having more significance at a global rather than at a national, Greek level. One of the leading archaeologists in the field, Geoff Bailey, made a plea in 1992 for increased support for training and research in Palaeolithic archaeology within Greece, stressing that this is the period when our species “acquired those most fundamental characteristics by which we define our humanity”. It therefore deserve, and let us hope will receive, greater recognition in the future.

Priene

City in Ionia

Priene was a small Greek city (population c.4000) on a peninsula in Asia Minor c.30 km south of Ephesus that flourished from the mid-4th century BC throughout the Hellenistic and early Roman periods. It is notable for being one of the most intelligible examples of ancient town planning, and its remains include most forms of public and domestic Greek architecture. The buildings, which are laid out on a grid plan, sit on the southern slope of Mount Mykale overlooking the Meander valley, c.15 km from the sea. In antiquity Priene was connected by a branch of the Meander river to its seaport at Naulochos on the bay of Latmos. The river silted up over time, however, causing the bay to become landlocked, and the city diminished in importance in later Roman times without access to a harbour.

Priene seems to have been founded originally at a different location, perhaps as early as the 2nd millennium BC, but its early history is known almost entirely from ancient authors, including Strabo, Herodotus, and Pausanias. In the 7th century BC it was one of the 12 major cities of Ionia and a member of the Ionian league. In the 6th and 5th centuries BC Priene was variously under the influence of the Lycians, Carians, Lydians, Phrygians, Athenians, and Persians. The city was refounded, probably by the Persian satraps the Hekatomnids, at its present location c. 350 BC, and it is from this date and throughout the Hellenistic period that most of the extant remains come. Priene, along with the other Greek cities of Ionia, was freed from Persian domination in 334 BC by Alexander the Great, who lived there while he laid siege to Miletus on the other side of the bay of Latimos. After Alexander's death Priene came under the control of various Hellenistic kings – Lysimachus, the Ptolemies, the Seleucids, and the Attalids. Upon the death of the last Attalid king in 133 BC, Priene passed into Roman hegemony along with the rest of the kingdom of Pergamum. By the 3rd century AD, with the river silted up, the city dwindled to a town half its original size.

Priene was designed according to the philosophy of orthogonal

town planning that was promoted by the renowned 5th-century BC architect Hippodamus of Miletus. Facing south to provide maximum light during winter, it was surrounded by a defensive wall with the main gate on the northeast and subsidiary gates on the southeast and west. High above and behind the city on the summit of Mount Mykale was a walled acropolis that was a permanent station for a military garrison. The urban water supply flowed down from the summit by aqueduct to reservoirs on the northeast of the city, and then was piped to public buildings and fountains. The streets were laid out as a grid, the six major streets on the east–west axis comprising a main thoroughfare 7.36 m wide and five others 4.44 m wide. These were intersected at right angles by narrower streets, 3.5 m wide, most of which incorporated steps because they lay on the north–south slope of the hill. The standard city block (insula) was 120 × 160 Attic feet. In the public areas of the city the buildings often took up an entire block or more, while in the domestic quarters each insula usually accommodated four houses.

Priene displays all the components necessary to the Classical Greek city (polis). At its heart was its major monument, honouring the city's patron, the 4th-century BC temple of Athena. An inscription states that it was dedicated in 334 BC in the name of Alexander the Great, who furnished the funds that were needed to complete basic construction. The temple was built by the renowned Carian architect Pytheos, who was esteemed as well for his work on the Mausoleum at Halicarnassus, one of the seven wonders of the ancient world. As was common practice among famed architects in antiquity, Pytheos wrote about his general architectural theories and he used as illustration the temple of Athena at Priene. His book, unfortunately, survives only in the commentary of Vitruvius. The ceiling of the peri-style was highly unusual in that it contained coffers carved in very high relief with scenes depicting gods fighting Giants and Amazons. The statue of Athena that stood within the cella was a replica of the colossal figure of Athena from the Parthenon in Athens. In front of the temple was the altar of Artemis, an ornate rectangular structure adorned with nearly life-sized figures carved in high relief set between attached columns.

To the east of the sanctuary of Athena was the commercial and social centre of the city, the agora. This large, open rectangle (75.64 × 35.40 m) contained various shops and was the site of many public meetings and festivals. To the north and south of the agora were other public buildings: the bouleuterion, the council house; the prytaneion, a smaller administrative building; stoas; gymnasia; a stadium; various temples and sanctuaries; and the theatre, whose ruins are impressive especially since they preserve the 2nd-century BC stage building more

completely than at most other sites of the period. Filling the insulae on the west and east sides of the city were private dwellings. The large number of houses surviving at Priene is particularly propitious, for ancient Greek domestic architecture can be studied to this extent at few other sites. The houses were relatively small, with several rooms surrounding an open court. While most appear to have been of one storey, some preserve stairs that would have led to an upper level.

Although Hippodamus was esteemed by Hellenistic Greeks as the inventor of formal city planning, Priene as a visual expression of his ideas was a relatively late example of orthogonal urban design. In the 2nd millennium BC Egyptian workers' villages at Kahun and Tell el-Amarna consisted of housing built in rectangular blocks along parallel streets. In the 5th century BC Herodotus (1. 180) describes the streets of Babylon as a grid, all being either parallel or perpendicular to the Euphrates river. In the Greek-speaking world, in the 7th century BC, both Smyrna in Asia Minor and Megara Hybleia in Sicily were built with parallel streets on orthogonal plans. Priene's position in the heart of the Hellenistic world provided it with greater influence than its size might otherwise have inspired. The fact that it was the site of an important temple built by a major architect also brought the city an extra measure of attention. Cities that were built or rebuilt under the Hellenistic kings or Roman emperors, e.g. Miletus, most assuredly were influenced by knowledge of orthogonal town planning at Priene.

Priene's influence seems not to have continued beyond the 3rd century AD when the city lost half its population and fell into disrepair. From that time it consisted primarily of poorly built houses and shops – constructed of materials from Hellenistic ruins – that extended over the original city streets destroying the grid plan. Priene was deserted from the 7th to the 10th centuries. Between the 10th and 13th centuries the site was reoccupied and Priene was a bishopric of the Metropolitan of Ephesus.

Priesthood

In Mycenaean Greece the king discharged religious functions that, for want of a better term, may be identified with those of a high priest. In Athens these functions came in time to be invested in an elected magistrate known as the *archon basileus* or king archon. However, in no period in antiquity did there exist any institution exactly comparable to our notion of priest-hood. The word *hierous*, which comes closest to “priest”, denoted an official attached to a particular sanctuary who supervised the *hiera* (sacred objects) stored within that sanctuary and who conducted the sacred rites connected with the cult. The most important of these were the performing of sacrifice, the purification of the sanctuary, the punishment of those who violated sanctuary regulations, and maintaining the buildings in good repair.

Since Greek religion did not concern itself much with morality, priests never functioned as spiritual advisers; their duties were primarily those of a liturgical and administrative nature. They were debarred from playing any part in the ceremonies connected with birth, marriage, and death because of the pollution that was believed to be associated with these events. Priests also lacked the technical competence and skill to pronounce upon matters arising from the practice of religious ritual; instead, when problems arose, particularly those having to do with pollution, religious experts known as *exegetai* were consulted.

Eligibility for priestly office was based on external qualifications. The most important qualification was the absence of any blemish or deformity, since it was believed that a blemish constituted evidence of divine disfavour. So far as we know, priests did not have to undergo any formal training, though they obviously had to be adept in the performing of their religious ritual. Since most temples were open to the public only a few days of the year, the holding of a priesthood was generally a part-time occupation. Priests were not paid for their services, though they were entitled to portions of meat from all the sacrifices performed in the sanctuary over which they had charge. Some had special seats of honour in the theatre of Dionysus. The more important priests were distinguished by their dress; the Hierophant of the Eleusinian Mysteries, for instance, wore a mantle, probably of

purple, a headband surmounted by a wreath of myrtle, and carried a staff.

As a general rule, gods were served by priests, goddesses by priestesses. Some priesthoods were hereditary, others were for a fixed term. In democratic Athens the newer priesthoods were annual appointments for which all members of the citizen body were eligible. The more venerable ones, such as that of Athena Polias or Poseidon Erechthtus, were reserved for members of a particular *genos* or noble kin-group. With few exceptions the powers of a priest were strictly curtailed and there is no evidence for any involvement *qua* priest in politics. Even in matters that had to do with religion, it was the citizen body as a whole, rather than the priesthood, that took all major decisions, without consulting the priesthood, at least in any formal way. Priests were not in a position to challenge the legal or political authority of the state because they never acknowledged any corporate identity. Thus when Socrates was accused of violating religious law in 399 BC, a group of individual citizens conducted the prosecution. Even so, it is probable that the major priesthoods carried considerable prestige. The priestess of Hera in Argos was so important that the Greeks based their system of chronology on the number of years that she had been in office (Thucydides, 2. 1).

Prostitution

In ancient Greece the sex trade was not illegal and there was a ready market for prostitutes who, in contrast to later Christian sexual ethics, were not regarded as improper objects of male desire. For Athenian men, who usually married in their thirties and for whom marital fidelity was not a requirement anyway, females under the protection of citizens, whether unmarried girls or married women, were, at least formally, strictly off limits and erotic relationships with such women could attract the severest penalties. Sex with prostitutes was much less risky and provided an outlet for “releasing the pressure of lust” (Xenophon, *Memorabilia*, 2. 2. 4).

Male prostitutes (*kinaidoi*) were much in demand; there was no overarching moral stricture on same-sex behaviour in antiquity and, while a man was expected to be the active sexual partner, the object of his desire could be male or female. However, just as relationships

with respectable women were restricted, so too there were formal restrictions regarding male partners; men of actual or potential citizen status were considered improper objects of a fully sexual relationship. Indeed, there could be serious civic consequences for citizen prostitutes; those who subsequently exercised their civic privileges invited prosecution and civic dishonour (a good example is the case of Timarchus in the 4th century BC, documented in Aischines, 1). However most prostitutes in antiquity, male and female, were slaves, and thus had no status to compromise.

While the all-embracing term of *ergasia* ("trade") denoted prostitution in Hellenic antiquity, prostitutes did not comprise a homogeneous category and there existed a broad spectrum of practice and status for those involved in selling sex. At the bottom of the heap were common prostitutes (*pornai*) who walked the streets and worked in the brothels of the Piraeus and the Kerameikos, still Athens' red-light district today. For brothel workers (always female) life could be grim; in one 5th-century BC text a concubine who fears her lover may send her to the brothel resorts to poisoning him (Antiphon, 1. 14). Other prostitutes, male and female, sat in cubicles (*oikemata*) open to the street, displaying themselves Amsterdam-style to prospective clients.

The Athenian state involved itself in the regulation of prostitution: *pornai* paid tax to the state, while Philemon (fr. 4) claimed that Solon established state-run brothels for the provision of cheap sex to all citizens as a democratic measure. The state also controlled the fees of flute girls and male kithara players, hired to provide musical and erotic entertainment at symposia, often the site of sexual dalliance; the mere appearance of an Athenian woman at a symposium could bring her reputation into question (Isaeus, 3. 13–14). In later periods too public entertainers were assimilated to prostitutes, perhaps because of their public visibility.

Courtesans (*hetairai*), on the other hand, exercised at least some choice in the bestowal of their favours and were hired for companionship as well as sex. Courtesans who commanded extravagant fees (*megalomisthoi*) could become rich and famous; Phryne, possibly the model for Praxiteles' *Aphrodite of Cnidus*, was reputedly rich enough to rebuild the city wall of Thebes (Callistratus, *On Courtesans*). Sometimes permanent attachments to men resulted and it can be difficult to distinguish the courtesan from the concubine (Aspasia and Theodote, the mistresses respectively of Pericles and Alcibiades, are two examples). Prostitution could even provide a way out of slavery and there are many examples of men buying the freedom of a favourite girl; Herodotus (2. 178) claims that Rhodopis of Thrace was redeemed from slavery by Sappho's brother and became

rich. However, Neaira of Corinth (a city renowned for its prostitutes) started life as a slave, was freed by her lovers, and then, following a legal prosecution, was sold again ([Demosthenes], 59). The sex trade offered a chance of social mobility to some but it was a precarious existence; prostitutes could come up in the ancient world, but they could also go down.

Certainly many ancient writers vilified prostitutes and condemned them for their extravagance and use of artifice; in the 4th century BC Alexis sneered at girls who compensated for their lack of natural charms with high heels, make-up, false breasts, and the ancient equivalent of a bustle (fr. 18). Men who frittered their money away on prostitutes or fought over them in the street also attracted criticism. Yet in pre-Christian Hellenic society it was not unacceptable for men to patronize prostitutes, who were regarded as a cure for dangerous desire, nor was the profession the object of religious disapproval; indeed Aphrodite was the tutelary goddess of prostitutes and temple prostitution in her honour is attested for Corinth (Strabo, 8. 6. 20), although this was unusual for Greece. Christianity, however, introduced a radically different slant on sexual continence. Marriage became the only proper outlet for male sexual desire and, indeed, a “defence against desire” (Brown, 1988). Paul advised one Greek community to marry rather than to burn (I Corinthians 7. 9), while in the 4th century John Chrysostom, hugely influential in the Orthodox Church, envisaged marriage not as a celebration of sexual love but as a method of avoiding fornication (*De Virginitate*, 19. 1. 1–2). One consequence of this was the outlawing of same-sex behaviour between men; an imperial edict of 390 demanded that male prostitutes in Rome should be burnt. Orthodox theology regards desire as the spiritual effect of original sin and the Church still censures fornication and male homosexual acts.

Ptolemies

Greek rulers of Egypt

The Ptolemies, Greek kings of Egypt, formed a dynasty that ruled the country from 305 BC to 30 BC. The Ptolemaic dynasty takes its name from the first such king, Ptolemy the son of Lagos, a Macedonian childhood friend and later general of Alexander the Great. Alexander conquered Egypt (then part of the Persian empire, which he set out to destroy) in 332 BC, during the early stages of his great expedition to the east. While in the country, he founded the city of Alexandria on the western branch of the Nile delta on the coast of the Mediterranean Sea. As Alexander passed on, the city was left in the hands of an architect and a financial administrator and it appears to have functioned as a Greek city from early on. It later became the royal capital of the Ptolemies, and among the greatest cities of the ancient world.

When Alexander died in 323 BC, his empire was divided for purposes of administration among his generals; Egypt passed into the control of this same Ptolemy, first as satrap (the Persian term for a provincial governor) and then as king. Ptolemy ousted the financial administrator Cleomenes, and finally had him killed for speculation in the grain trade. The country remained firmly under Ptolemy’s control throughout the power struggles that took place among Alexander’s successors during the next 20 years. Generally he concentrated on consolidating his power in Egypt, eschewing the territorial ambitions

of his fellow successors in Asia and Greece. In 305 BC Ptolemy declared himself king, as did other successors in their own territories.

Ptolemy I Soter (“Saviour”, an epithet he received after helping the island of Rhodes during a siege) established a secure kingdom, which for the next three centuries was to be ruled by his direct descendants. A mark of his political acumen was the fact that he was the only one of Alexander’s successors not to die a violent death in battle. Greek civilization and culture came to Egypt, and settlers from Greece and Macedonia were actively encouraged. Alexandria and other cities in Egypt grew with the influx of the new ruling class. Certainly it can be maintained that a veneer of the Greek way of life was imposed on the native civilization of Egypt. To Ptolemy I’s early patronage can probably be attributed the foundation of the famous library of Alexandria, in which the works of Greek literature were codified, copied, studied, and therefore preserved for posterity. Attached to the library was the museum (“Shrine of the Muses”, the patronesses of intellectual arts), a residential study facility which attracted the finest Greek scholars and writers of their day. Alexandria became the capital of Greek culture, overtaking Athens as its centre.

Ptolemy I made his son co-regent in 285 BC, and the latter on his father’s death in 283 became Ptolemy II (later to receive the cult title Philadelphia, “sister-loving”). During his long reign Ptolemy II presided over the growth of Alexandria into a famous and rich capital. The library and museum flourished, the wealth of Alexandria and its kings became proverbial among contemporary writers, and Ptolemy II amassed the greatest navy ever known in the Greek world. The largest political clouds on the horizon were Egypt’s constant dispute with the Seleucid kings over Coele (“Hollow”) Syria, the area known as the Middle East today. Two wars were fought over this territory in Ptolemy II’s reign. In the mid-270s BC Ptolemy married his full sister Arsinoe (known as Arsinoe II Philadelphus), a clever woman who abetted his political schemes. This established the custom of royal brother–sister marriage in Ptolemaic Egypt, although at the time the Greeks were scandalized at the notion of incest.

Ptolemy III, known as Euergetes (“Benefactor”), succeeded his father in 246 BC. His reign is best known for the Third Syrian War, in which he invaded the Seleucid Syrian empire to support the claims of his sister Berenice Syra (“the Syrian”) as queen to the Seleucid throne. (The Greek poet Callimachus wrote a poem called “The Lock of Berenice” to describe the dedication of a lock of hair by Ptolemy’s queen, also named Berenice, to ensure his safe return from the war. The lock was, according to the poem, apotheosized into a constellation and subsequently spotted in the heavens. Although only fragments now remain of Callimachus’ poem, it was translated into Latin by the

Roman poet Catullus and is one of the most famous ancient poems.) The sister Berenice Syra had already been murdered when Ptolemy arrived. Although he captured some important cities in Asia Minor, this appears to have been the limit of Ptolemaic expansion.

So far the 3rd-century Ptolemaic empire had been characterized by good kings and stable government. With the accession of Ptolemy IV Philopator ("Father-loving") in 221 BC, the situation changed. Ptolemy IV's predilections were more for intellectual and dilettante pursuits than for politics, and he succumbed to the control of unscrupulous ministers. Although he won a great victory in the Fourth Syrian War at the Battle of Raphia in 217 BC, he failed to press for any concessions in the peace treaty. After Raphia, Egypt was shaken by severe internal revolts, and in 206 BC by the secession of Upper Egypt for 20 years. The lack of any positive foreign policy continued, and Ptolemy IV and his sister-wife were eventually murdered by his ministers in 205 BC, their deaths being kept secret for some time.

Ptolemy V Epiphanes ("Made Manifest") acceded to the throne as a child following his father's murder. Other Greek Hellenistic kingdoms unsuccessfully colluded to divide Egypt between them. The end of the Fifth Syrian War brought him a wife of the Seleucid house, the first of the Ptolemaic queens to be called Cleopatra. Ptolemy V was crowned in traditional Egyptian fashion at the old dynastic capital Memphis, south of Cairo. He was the first of the Ptolemies to be crowned pharaoh, although all had been depicted in native dress in statues and temple reliefs. The priestly decree of 196 BC which followed his coronation is the famous trilingual Rosetta Stone (now in the British Museum) written in outmoded Egyptian hieroglyphics, current Egyptian demotic, and Greek. The Greek part of the Rosetta decree enabled translators for the first time to decipher Egyptian hieroglyphics, one of the most important advances ever made in latterday understanding of ancient Mediterranean history.

Ptolemaic Egypt of the 2nd century BC was a fundamentally different world from that of the 3rd century BC. All the Hellenistic Greek empires were affected by the growing power of Rome and its increasing interest in the Greek east, and Egypt was no exception. Beginning with Ptolemy VI (a child king like his father), who acceded to the throne in 180 BC, successive Ptolemies warred among themselves and collateral relatives, reunited, ruled jointly, and fell out again. The practice of incestuous marriage between siblings may have had adverse genetic effects over generations. Fraternal civil wars, exile, incest, murder, and even matricide are well-documented features of Egypt in the 2nd century BC. A prime example of the rulers of this period is Ptolemy VIII Euergetes II, also called Physkon ("Potbelly"). He succeeded his brother Ptolemy VI, killed his nephew Ptolemy VII

(the son of his brother Ptolemy VI and sister), married Ptolemy VI's widow, who was also his own full sister, and concurrently married the daughter of his brother and sister (his double niece). He produced children by both wives, and also an illegitimate son. It is almost inconceivable to imagine how this complex marital situation functioned, with a man married at the same time to both his sister and her daughter, but inscriptions attest to a triple joint rule for at least some of the period, although civil war did break out intermittently.

After Ptolemy VIII the situation did not improve. Quarrelling brothers found that the temptation to invoke Rome to support their side against their rival proved too difficult to resist. No strong king emerged to bring the matter under control, and the Alexandrian populace, increasingly disgusted with the dynastic debacle, seized power. Finally, in the early 1st century BC either Ptolemy X or Ptolemy XI bequeathed the kingdom of Egypt to Rome, ensuring that the last half-century of Ptolemaic rule was inextricably entwined with the history of Rome.

The legitimate line of the Ptolemies died out with the deaths of Ptolemy IX, X, and XI. Ptolemy XI was actually established on the throne by the Roman dictator Sulla in 80 BC, but he soon murdered his stepmother (to whom he was then married), and was in turn himself murdered by the Alexandrian mob, who resented Rome's interference in their country as well as the murder of their queen. The succession passed to the illegitimate son of Ptolemy IX, who became Ptolemy XII, known as "Auletes" ("Flute player", indicating his frivolous tendencies). Auletes and his sister-wife Cleopatra V probably had six children together, among them the girl destined to become Cleopatra VII, the last Ptolemaic ruler of Egypt.

Far from secure on his throne, Ptolemy XII depended on the firm support of Rome. In 59 BC he paid a huge sum of money to be formally declared a friend and ally of Rome, but the wrath of the Alexandrian mob drove him into exile in 58 BC. Auletes fled to Rome to the protection of Pompey, one of the triumvirs (three generals who jointly ruled in Rome), and then to the city of Ephesus in Asia Minor. The two eldest daughters of Auletes appear to have ruled Egypt in his absence; one soon died, but the marriage of the other to the alleged son of Rome's Parthian enemy Mithradates VI caused consternation in Rome. From a Roman point of view, Ptolemy XII seemed preferable to his maverick second daughter; in 55 BC, with the help of Roman troops, he was escorted back to Egypt by Aulus Gabinius, the Roman governor of Syria, and reinstated on the throne. He had his second eldest daughter killed, and ruled until his death in 51 BC.

The eldest surviving child of Auletes was now Cleopatra, who was declared queen and who as Cleopatra VII Philopator ruled jointly with

her younger brother Ptolemy XIII (then no more than a boy), whom she married in accordance with Ptolemaic custom. Ambitious ministers contrived to control the boy king and divide him from his sister, who even as a girl of 18 was showing signs of political cunning. Cleopatra was forced to flee Egypt. She then became involved in the consequences of the civil war between Pompey and his rival Julius Caesar. Caesar came to Egypt in pursuit of Pompey, and decided to support the claims of Cleopatra against her brother. The so-called Alexandrian War of 48–47 BC ensued in which Caesar and Cleopatra were victorious, and Ptolemy XIII was killed. Cleopatra was reinstated on her throne by Caesar and married her younger brother Ptolemy XIV, ostensibly ruling jointly with him.

A legendary Nile cruise was then enjoyed by Cleopatra and Caesar, a married man some decades older than the queen. When he left Alexandria she was pregnant, and bore a son (probably Caesar's child) named Caesarion. Cleopatra spent the years 46–44 BC in Rome with Caesar and their son, but had no option but to return to Egypt after his assassination in 44 BC. Caesar's supporter Mark Antony and adopted son Octavian (later to become the Roman emperor Augustus) initially joined forces to defeat Caesar's assassins, but Antony and Octavian later became rivals for ultimate power in Rome. Antony's agreed control of the eastern part of Roman territory set the stage for Cleopatra's cataclysmic meeting with him in 41 BC, when he summoned her to meet him at Tarsus in Cilicia.

For 11 years Cleopatra was intermittently associated with Antony (who at the time was married to a succession of Roman women including, finally, Octavian's half-sister), and she bore him three children. Antony's political differences with Octavian, his liaison with a foreign queen deemed dangerous by the Romans, and Antony's and Cleopatra's apparent dynastic ambitions for their children meant that war was inevitable. Rome declared war upon Egypt. At the battle of Actium in 31 BC the combined forces of Antony and Cleopatra were defeated by Octavian, who pursued the couple back to Alexandria. With defeat now inescapable, Antony committed suicide, followed by Cleopatra some days later.

With the death of Cleopatra the Ptolemaic dynasty ended (her son Caesarion was killed, and the fates of her two sons by Antony are unknown). Egypt lost its independence and became a province of Rome until its conquest by the Arabs in AD 642. Despite the gradual decline of the Ptolemies from their glorious beginning in the 3rd century BC through to the petty internecine squabbles of the 1st century BC, Ptolemaic Egypt remained independent from Roman control longer than the other Hellenistic empires. The upper echelons of Greek society made it a Greek kingdom which can be credited with

the creation, preservation, and transmission of Greek culture and ways of life.

Ptolemy

Astronomer and geographer of the 2nd century AD

Claudius Ptolemaeus (more usually known to English-speakers as Ptolemy) worked in Alexandria, and the astronomical observations he records suggest that he was active in the middle of the 2nd century AD. We know virtually nothing else about him.

Ptolemy's principal astronomical work, the *Mathematike Syntaxis* (Mathematical Treatise), is usually known in the modern world as the *Almagest*, which is derived from the Greek *megiste* ("greatest") with the Arabic definite article added to it, a name that bears witness both to the dominant position the *Almagest* established in ancient astronomy,

and to its influence on later astronomers. The *Almagest* is the culmination of the attempts of Greek astronomers to create a mathematical model that would account for and predict the observed movements of the heavenly bodies (the fixed stars, the sun, the moon, and the five known planets), on the basis of regular movements in circles and taking the earth as the fixed point. This is indeed mathematically possible, but, looked at on this basis, the movements are very complex, and incorporate many very small variations, so that the weaknesses of any particular model might become apparent only when errors had accumulated over centuries of observation. Ptolemy's great achievement was to devise a model that not only produced a very close match to what was observed, but was also capable of modification and could be refined as new inconsistencies were identified. For this reason it was not seriously challenged for 1300 years; it was only in the 16th century that it was realized that the mathematics could be simplified enormously by taking the sun as the fixed point and having the earth as well as the planets move round it in orbits which were elliptical, not circular. Ptolemy builds principally on the work of Hipparchus, active some three centuries earlier, and uses the epicycles (orbits around the circumference of a circle whose centre is itself moving round the circumference of another circle) and eccentric circles (circles whose centre is not the sun) that were the basis of Hipparchus' system. Book 1 incorporates a Table of Chords which is in fact the equivalent of a modern sine table, and reveals considerable knowledge of trigonometry; Ptolemy certainly did not invent trigonometry (for it had already been used by Hipparchus), but his full and clear exposition of its principles is one of the foundations of the modern development of the subject. Book 2 deals with the geometry of the heavenly sphere; book 3 is on the sun; books 4 and 5 are on the moon; book 6 discusses eclipses; books 7 and 8 are on the fixed stars, and include a catalogue of stars; the rest of the work (books 9–13) deals with the complex problems of the movements of the planets. It is difficult to be sure which elements of the system described in the *Almagest* are Ptolemy's own, and which are derived from his predecessors (and indeed many of the observational data he uses must have come from earlier astronomers). It is, however, the sophistication and adaptability of the system that guaranteed that it would dominate subsequent astronomical thought, and for this Ptolemy can clearly claim the credit.

Almost as important and influential is his other main work, the *Geography*, an attempt to systematize and map everything known about the world at the time. We cannot tell whether Ptolemy himself ever produced such a map (the maps that are found in surviving manuscripts are certainly derived from Byzantine originals), but the

material in the *Geography* is presented in such a way that drawing a map from it would be relatively easy. Ptolemy had predecessors in this (he himself acknowledges his dependence on Marinus of Tyre, who is otherwise unknown), but it is likely that the use of lines of latitude and longitude to define positions on the earth's surface may be Ptolemy's own original contribution. Impressive though the mathematical and geographical concepts in the work are, the factual basis on which the *Geography* rests was inadequate (and could hardly be otherwise, since for most of his information Ptolemy would have been dependent on the reports of others, and sometimes he would have had nothing to use but travellers' tales). Within the Roman empire his information is reasonably accurate, but further afield it is completely unreliable. Errors in some of the astronomical data on which he relies (observations of the time at which eclipses were observable in different places, for example) inevitably produce distortions. Nevertheless it was not until the 16th century that it was entirely superseded.

Less well known in the modern world, but almost as influential, was Ptolemy's *Harmonics*, which built on the work of Aristoxenus, and is most notable for the balance it strikes between empirical and mathematical approaches. It is an invaluable source of information on the views of earlier writers, and on ancient musical practice, and had great influence on the theory of music in the Middle Ages (through Boethius) and in the Renaissance.

Among Ptolemy's other works are: the *Tetrabiblos* (so called because it is in four books), an astrological work based on the principles of the *Almagest* and perhaps an attempt to put astrology on a scientific footing; the *Optics* in five books (surviving only in part, in a Latin version of an Arabic translation) which deals with reflection and refraction, and represents a substantial advance on Euclid's *Optics*; the *Planisphaerium* (surviving in Arabic and Latin translations) dealing with the geometry of the celestial sphere and in particular the system of stereographic projection of the heavenly sphere on to the plane of the equator; the *Analemma* (surviving only in Latin translation, with some fragments in Greek) on the orthogonal projection of the sphere on to a single plane; and the *Phaseis Aplanon Asteron* (of which only the second book survives) on the weather associated with the heliacal risings and settings of prominent stars. He is also said to have written a rather unimpressive minor philosophical work, *On the Criterion and the Ruling Faculty*. Proclus tells us that he tried to prove Euclid's controversial parallel postulate (Postulate 5) and gives us excerpts from the proof. Ptolemy is also credited with works on dimensions and on mechanical problems.

Purple

In ancient Greece the colour purple was an emblem of conspicuous consumption, a symbol of wealth and prestige. The most favoured dye was extracted from shellfish found in the Mediterranean, a process that was developed in the Near East by the Phoenicians around 1400 BC. They searched every coast known to them – from the Sea of Marmara to Asia Minor, from Greece to southern Italy, from Lebanon to north Africa – for murex shellfish, establishing factories and trade centres. Common species producing sea purple were *Murex trunculus*, with a blue-purple hue, and *Murex brandaris*, known to the Venetians as Turk's Blood because of its dark red stain. Producing purple was a painstaking and costly process despite cheap labour. Enormous quantities of the molluscs were needed for the potent colourfast pigment, which was extracted from the mucus glands of freshly killed sea snails. They yielded an almost black liquid called *anthos* (blossom) by Greek dye workers. Exposure to air and sunlight developed the purple hue. Modern experiments using 12,000 *Murex brandaris* and a high extraction technique have yielded 1.5 g of dye. Though it is

difficult to equate ancient costs with modern currencies, the price of sea purple in Greece around 200 BC might be estimated at \$28,000 a kilo. Dye workshops, with their spoil heaps of discarded shell fragments and bits of decaying shellfish, were neither clean nor savoury places of employment. The Greek geographer Strabo said that the Phoenician dye centres of Tyre and Sidon were so putrid that they were “unpleasant for residence”. One could easily identify dye workers by their brightly coloured hands and arms as well as the smell that clung to their bodies and clothing.

The demand for purple exceeded its supply and in the ancient world cheaper and more plentiful substitutes were developed by diluting the true organic dye with water, urine, or honey, or by using animal or vegetable material that approximated to the desired colour. One such source came from the kermes insect called *coccus ilicis* which produced a colour between blue and red. There were industries devoted to the production of counterfeit purple from cheap materials such as mulberry juice, amaranth blossoms, and crushed bloodstone. Papyrus fragments found in Egypt containing dyeing recipes are based on four books attributed to the Greek philosopher Democritus, who reportedly dabbled in alchemy, converting substances that yielded the desired colour and lustre to textiles that would fool even connoisseurs of the coveted hue.

Ancient historians and poets wrote about purple textiles and their production. The most famous dye centre in Greece was at Hermione in Argolis; its textiles were in demand throughout the Mediterranean and coveted by the Persian court. Robes made at Hermione were entirely purple with a broad vertical white stripe. In Thessaly the workshops of Meliboea were praised by ancient writers for the quality of the dyes produced there. The town of Bulis in the Gulf of Corinth engaged more than half the population in harvesting and processing the molluscs. Spartan law prohibited dyers from the region as falsifiers of nature. Yet, with time, Pliny claimed that the shellfish along the Laconian coast and on the island of Cythera provided the best purple dye in the world. The islands of Euboea, Chios, Rhodes, Cos, and Cyprus yielded an excellent quality of purple. In the west the cities of Syracuse and Tarentum were also noted for their purple dye centres. In fact, a hill in Tarentum named Mount Testaccio is made up entirely of broken murex shells, both the *trunculus* and *brandaris* types.

The *Iliad* makes numerous references to garments of purple worn by kings and generals. In the *Odyssey* the hero Odysseus is given a cloak dyed sea purple by his wife, Penelope. Purple robes were deemed worthy offerings to Apollo at Delphi by king Croesus of Lydia, according to Herodotus. The poetry of Sappho relates the high esteem of purple garments as gifts for gods and goddesses. Greek lyric poets

of the 5th century BC equated purple with the garments of heroes and gods. Parrhasius of Ephesus was notorious for his luxurious tastes including a purple cloak, which was considered to be well above his status as a painter. Plato, one of the Athenian moral majority, considered purple to be a decadent emblem of wealth and an effeminate article of clothing. However, despite the conservative views of Athenian philosophers, by the 4th century BC the use of purple was fairly widespread in Greece. What had previously been a mark of Persian tyranny and decadence was transformed by Alexander's defeat of Darius in 330 BC into an accepted status symbol, when he exchanged his white Macedonian robes for the coloured trappings of royalty brought to the Mediterranean world by Phoenician traders.

The Greeks did not associate the colour purple with the same mystical qualities as it enjoyed in the Near East. However, they too dressed their deities in purple and the ancient association of the colour with war persisted. Its psychological and aesthetic peculiarities were of the utmost importance. Greek generals wore purple and its significance was promoted in the dress of singers at festivals in honour of the gods. In the Classical and Hellenistic periods purple enjoyed a sacrosanct and noble status, adorning distinguished people. It was common, therefore, for great statesmen, actors, courtesans, and wealthy citizens to wear purple as a rather blatant show of power and status. A 4th-century BC grave of a woman in south Russia yielded some purple cloth that was painted on with a brush. The colour was frequently used as paint, rather than as a dye, and was also employed as a cosmetic.

The Romans, like the Macedonians, originally wore white or natural-coloured garments. However, over the course of time certain robes became associated with specific officials or priests for wear on festivals and other sacred occasions. One of these was the purple pallium of the priesthood. An old Roman family, named after Furius Purpureo, had the purpura shellfish as its insignia. Centres of international trade included the dye workshops of Greece, which were especially important in promoting a desire for the exotic and expensive colour. The first official documented to have worn a purple robe was an aedile named P. Lentulus in 63 BC. Purple stripes were worn on the togas of officials and eventually became the privilege of senators. As the colour became more popular, the purple trade flourished in Rome and dealt in many items, mainly textiles but also leather, ivory, pottery, marble, and stone. Porphyry, a deep purple stone imported from Egypt, was used as the material for sarcophagi for the royal family of Constantine the Great and for statuary of the Tetrarchs, to name a few examples.

Pydna

City in Macedonia

Pydna was a Greek city founded on the east coast of Pierian Macedonia on the Thermaic Gulf in the 7th–6th centuries BC. An acropolis site on the coast south of the modern village of Makriyialos is now thought to have been its original location. The city played an occasional role in political events in Greece in the 5th and 4th centuries BC, and, as such, is attested by Greek historians of the period. The 5th-century king Alexander I of Macedonia was known as the "Philhellene", but his interests inevitably clashed with those of Athens in northeastern Greece. When the Athenian general Themistocles fell out of favour and fled from Athens, he was given refuge at Pydna by Alexander in the early 460s BC before escaping to Asia. In the build-up to the Peloponnesian War and the revolt of Potidaea in 432 BC, Athens briefly besieged Pydna, hoping to establish a base there for operations in the north.

In 410 BC the Macedonian king Archelaus I captured Pydna and refounded the city as a Macedonian town some distance inland to the northwest, probably to guard it from attack from the sea. This was the site of Macedonian and Roman Pydna, near the modern village of Alonia. The inland site continued to be inhabited after the coastal site was reoccupied after Archelaus' death in 399 BC. In the late 360s BC, during the establishment of the Second Athenian Confederacy, Pydna was among the cities seized by the Athenian general Timotheus to provide bases against Macedon and Chalcidice, but the Macedonian king Philip II, in the course of his campaign to subdue Greece, captured Pydna, probably in 357 BC, along with other Greek cities along the Macedonian coast. Pydna was treated harshly and

garrisoned.

At the end of the 4th century ^{BC} Pydna briefly took centre stage in the violent political struggles that followed the death of Alexander the Great. Alexander's Epirot mother, queen Olympias (the first wife of king Philip II of Macedon), was a formidable woman and a dangerous opponent. She championed the claim to the Macedonian throne of her grandson, Alexander's posthumous child, and, to this end, engineered the deaths of the rival claimant Philip III Arrhidaeus (an illegitimate son of Philip II) and his powerful wife Eurydice. She thereby incurred the fury of Cassander, the son of the old regent Antipater, who had supported Philip III as the legitimate king. In the face of Cassander and a large army, in 317 ^{BC} Olympias and her royal retinue went to Pydna, whereupon the town was besieged by land and sea. Relieving forces from outside were persuaded to abandon Olympias, and many inside Pydna deserted to Cassander when a grievous famine incapacitated the besieged. In the spring of 316 ^{BC} Olympias surrendered to Cassander and was condemned to death in absentia by the general assembly of the Macedonians. Although she refused proffered exile, and Cassander's troops were too awestruck to kill her as ordered, Olympias was eventually murdered at Pydna by the relatives of some of her past victims. (The story of the siege of Pydna and the death of Olympias is told in Diodorus Siculus, 19. 35–36, 49–51.)

Three important inscriptions of a later date were found in the vicinity of Pydna which refer to the tomb of Olympias and the nearby burial of descendants of the Aeacidae, the royal house of Epirus to which Olympias herself belonged. These texts indicate, surprisingly, that members of this family were living at Pydna in the 2nd century ^{BC} after the Roman conquest of Macedonia (see below), and that the tomb of Olympias was revered. Pydna therefore occupies a complex place in the Hellenic tradition: on the one hand, it witnessed the first of many brutal deaths of Alexander the Great's immediate family, but, on the other, it sheltered Alexander's maternal Epirot descendants long after the Antigonid dynasty of Macedonian kings had been destroyed by Rome.

The tomb of Olympias has never been found, and a suitable historical context for its construction can only be surmised, but burials in typical Macedonian chamber tombs are known from this area (for example the so-called Tomb of Pydna, an elaborate multiroomed chamber tomb probably dating from the end of the 3rd to the beginning of the 2nd century ^{BC}).

Pydna is best known as the site of the great battle between the forces of the Macedonian king Perseus (son of Philip V) and the Roman general Lucius Aemilius Paullus in June 168 ^{BC}. The decisive

Roman victory, in which some 20,000 Macedonians were killed and some 11,000 taken prisoner, brought to an end the Third Macedonian War and had catastrophic consequences for the future of Macedonia and northern Greece. Perseus and his family were eventually captured and sent to Rome. The king marched in chains in Paullus' triumph and died soon after in captivity, thus ending the Antigonid dynasty of Macedonian kings. The vast wealth of Macedonia, especially the royal palace at Pella, was plundered and taken to Rome to be paraded in the three-day triumph (see Plutarch's *Life of Aemilius Paullus*, 30–35, for an account of the staggering number of art treasures borne along on waggons). Paullus embarked on a “reign of terror” by allowing Epirus to be sacked (as many as 150,000 citizens were enslaved) and condoning other reprisals, even as he himself embarked upon an archaeo-logical tour of Greece. The kingdom of Macedonia lost its independence as a nation, was divided into four republics with elected magistrates, and paid heavy taxes to Rome. It became a Roman province in 146 BC.

The aftermath of the Battle of Pydna had two unexpected consequences for the spread of the Hellenic tradition. The first was that a young man named Polybius, son of Lycortas of Megalopolis in Achaea, was taken to Rome among the hostages deported after Pydna and became a close friend of the influential Roman Scipio Aemilianus, in whose circle he travelled widely and became privy to Roman political life at a high level. Polybius returned to Greece in 146 BC and became a distinguished historian. His *Histories* cover the years 264–146 BC (focusing on the period 220–168 BC) when Rome established its control over most of the inhabited world, which Polybius – given his background – saw as a unique event and sought to explain. His lucid narrative remains the main historical source for the period when Rome became master of the Greek east.

The spread of the Greek artistic tradition was also a byproduct of the Battle of Pydna. Plunder brought to Rome made the Roman people aware of masterpieces of Greek art in the media of bronze and marble statuary, painting, and toreutic art. Greek art had a profound effect on the style of Roman art because of this contact. It is perhaps a historical irony that Paullus commandeered for a statue of himself a pillar erected at Delphi that was originally intended for a statue of Perseus. It was topped with a bronze equestrian statue of himself above a sculpted frieze depicting a battle between Romans and Macedonians, that is, a real rather than a mythological battle. The Greek tradition of this type of monument was adapted by the Roman general for his own purposes, and was perhaps the first in the great tradition of Roman historical reliefs.

Pylos

City (or cities) in the western Peloponnese

Pylos now refers to four distinct places in the western Peloponnese, largely as a result of the attempts to identify the site of Nestor’s palace as described by Homer. These are discussed from north to south.

In 1907 the German archaeologist Wilhelm Dörpfeld discovered and excavated three tholos tombs and the ruins of a building at *Kakovatos*, c.40 km south of Pírgos. He therefore concluded the site was Pylos as, following Strabo, many Alexandrian scholars had postulated that the Homeric site lay in Triphylia, an area also notable for the sandy beaches characterized in the epics.

The site at *Ano Englianos* (50 km south of Kiparissia) was identified in 1938 by a Hellenic–American expedition and excavated in 1939 and 1952–64 by Carl Blegen of the University of Cincinnati. A Mycenaean palace on a low hill with associated tholos and chamber tombs has been uncovered. It is the most comprehensible of all the Mycenaean palaces, though it is less impressive with its mudbrick walling and low elevation. The most important discovery was an archive room beside the entrance containing over 1000 tablets inscribed in the Linear B script; others and other types of

administrative records were found elsewhere on the site. The palace was decorated with wall paintings in fresco; it had a central hearth in the megaron surrounded by four fluted columns in wood with clay chimney above. In the private wing was a bathroom with small tub. Copious evidence of pottery in functional contexts as well as stores of wine and oil contributes with the texts to a still unique picture of Mycenaean elite life. There are remains of a lower town at the base of the hill but little excavation has been carried out here. Since 1990 further study of the site and the region in general has been carried out by the American School of Classical Studies. Finds are to be seen in a small museum at nearby Chora with the most important items in the National Museum in Athens.

The rocky promontory of *Koryphasion* lies at the north end of the bay of Navarino. This bay (like that of Methone to the south) was, and still is, an important feature in the safe navigation of the west coast of the Peloponnese and the history of the area reflects this importance. Heinrich Schliemann in 1888 (after a preliminary visit in 1874) investigated the acropolis area, which was known as Old Pylos, and the cave of Nestor at the north end. In 1896 a French expedition also undertook some exploration in the cave. Ancient pottery (Middle Helladic to Roman) came to light. The small rounded bay to the north may have been the Mycenaean harbour. The southern tip of the promontory was fortified in 425 BC by the Athenians under Demosthenes and Cleon in order to cut off the Spartan contingent on the island of Sphacteria which closes the large southern bay on the west. The engagement is described in detail by Thucydides (4. 3ff.) and by Peter Green in a modern semifictional account. One of the shields, captured from the Spartans on their surrender after the dramatic siege of 72 days and later dedicated in the Stoa Poikile in Athens, came to light in the excavations of the Athenian Agora and is displayed in the Agora Museum.

Pyrrho c.365–275 BC

Philosopher

Pyrrho of Elis is regarded as the founder of Greek scepticism. He is

said to have studied with a certain Bryson and the Democritean Anaxarchus with whom he travelled to India in the campaign of Alexander the Great. His acquaintances with the “gymnosophists” and the “magi” are said to have influenced his thought. Pyrrho did not leave any writings, but some knowledge about his teaching comes from his disciple Timon of Phlius (c.325–235 BC), a literary man who wrote satires (*Silloi*) parodying all dogmatic philosophers and contrasting them with Pyrrho. Pyrrho did not establish a school of philosophy in the institutional sense. There were no successors after Timon, although ancient doxography tried to invent a succession down to Aenesidemus (1st century BC). Pyrrho’s teaching as transmitted by Timon enjoyed a revival several centuries later with Aenesidemus and Sextus Empiricus (2nd century AD), who systematized it. Our main sources for his philosophy are a substantial *Life* by Diogenes Laertius (9. 61–108), fragments from the Peripatetic Aristocles’ *History of Philosophy* (1st century AD?) preserved by Eusebius (*Praeparatio Evangelica*, 14. 8), and the writings of Sextus Empiricus (especially his *Outlines of Pyrrhonism*).

However, these later sources do not always represent Pyrrho’s teaching and there is some evidence that his later followers imposed a certain interpretation on his philosophy. Yet, given the state of evidence, it is extremely difficult to distinguish Pyrrho’s original teaching from the later interpretations of it.

Pyrrho was primarily a moralist. His aim was to live a life of tranquillity (*ataraxia*). He apparently argued that everything was utterly indifferent. He maintained that there is no difference between good and bad things, just and unjust, and the like, and argued that it is only a matter of convention or habit that people believe things to be good or bad. Pyrrho was concerned to refute any natural basis for evaluating a thing as good or bad, but apparently he did not make the further move to dispute the possibility of knowing whether things are good or bad. On the contrary, he dogmatically asserted that things are neither good nor bad, and that they are only designated as such by convention. He seems to have expressed his ideas using a language such as this: “*x* is no more [*ou mallon*] this than *y*.” Using such a non-committal language (already used by Democritus), he avoided making any value judgements. Yet this is not tantamount to the sceptic suspension of judgement (*epoche*) with which he was later accredited. Although Pyrrho may have distinguished sharply between *x appearing y* and *x being y*, he was concerned with the evaluation of things and not with the perceptual experience of them, i.e. with the question of the possibility of knowing them or with the nature or their apparent characteristics; and as far as their evaluation was concerned he found them indifferent. Dispensing with value judgements, Pyrrho liberated

himself from all the anxieties that conventional value judgements impose on us and thus he was able to live a life of tranquillity and lack of affection (*apatheia*). Pyrrho's aim of achieving detachment from human concerns is confirmed by a number of anecdotes. He took no precautions against dogs, carts, and precipices and he was always saved by his friends. Again Pyrrho did not seem to act in this way because he disputed the evidence of the senses but because he considered that things were indifferent to him and that whatever might happen was of no account to him. Although Pyrrho found it hard to be entirely indifferent, he did attain a remarkable degree of imperturbedness.

So Pyrrho's main thesis was apparently neither epistemological nor metaphysical but primarily ethical. Yet his attitude was interpreted as a sceptical one by his followers, Timon, and by the later Pyrrhonians who relied on Timon. Timon reports that Pyrrho argued that things in themselves are indifferent, immeasurable, and inarbitrable. Hence our perceptions are neither true nor false, their testimony is unreliable, and we should think that something is no more this than that. The moral to draw was that we should not commit ourselves to views about the nature of things on the basis of our senses since things are elusive and undetermined. This attitude may lead us first to speechlessness and then to imperturbability, which finally makes up a good life – admirably achieved by Pyrrho. Timon obviously understands the “no more this than that” formula as concerning the trustworthiness of perceptions and beliefs. According to this interpretation indifference is a result of diffidence to perceptions and beliefs and not to the value of things themselves. This interpretation is patterned on the main idea underlying the history of Greek scepticism and it could easily be imposed on Pyrrho's teaching. Yet there might well have been aspects of Pyrrho's teaching that encouraged such an interpretation.

Pyrrho's scepticism enjoyed a revival with Aenesidemus, who seceded from the sceptical Academy under Philo of Larissa and appealed to Pyrrho's radical scepticism because he wanted to restore scepticism in its pure form, castigating Academic scepticism, which tended to become more and more dogmatic. With Aenesidemus and later Pyrrhonians the focus shifts clearly to epistemology. Aenesidemus disputed the anecdotes about Pyrrho's life and maintained that Pyrrho's philosophy was based on suspension of judgement. He also added that suspension of judgement may lead us to pleasure too. Aenesidemus is well known for the systematization of the Pyrrhonian arguments against holding a belief in ten modes. By means of these modes the Pyrrhonian sceptic would be able to question any dogmatic claim or demonstration and to show how ill-

founded they were.

Many Pyrrhoneans after Aenesidemus were physicians of the empirical school of medicine. Most prominent among them was, of course, Sextus Empiricus. Sextus is for us today the major exponent of Pyrrhonian scepticism, but it is evident that he relies much on Aenesidemus. In his main expository work of Pyrrhonian philosophy, the *Outlines of Pyrrhonism*, Sextus makes interesting distinctions between the Pyrrhonian and the other philosophies and he devotes a long section on the significance of standard sceptical phrases.

Pyrrhonian scepticism, like all forms of scepticism, was polemicized by Christian intellectuals in the Middle Ages since it undermined Christian dogma. Photios obviously had access to some of Aenesidemus' works and he reports on them in his *Bibliotheca*. In the Renaissance Pyrrhonian scepticism, like most ancient philosophical systems, enjoyed a revival, but there is little trace of a considerable impact on modern Greek philosophy. Recently, though, Pyrrhonian scepticism has been found appealing and modern Greek intellectuals such as Nikos Demon have stressed that it offers an honest alternative to philosophical discussions.

Biography

Born c.365 BC, Pyrrho of Elis was a pupil of Bryson and Anaxarchus. With Anaxarchus he travelled to India with Alexander the Great, where he was influenced by local sages. Pyrrho returned to Elis and lived quietly. He is regarded as the founder of scepticism but he left no writings and did not establish a school. Knowledge of his teaching derives from the writings of his pupil Timon of Phlius. He died in 275 BC.

Pyrrhus 319–272 BC

Ruler of Epirus

Pyrrhus became king of the Molossians and created the kingdom of Epirus. As ruler of Epirus, he became one of the most respected military leaders of the Hellenistic age. He was revered in his own lifetime and later in antiquity for his expertise and military knowledge: Hannibal described him as the greatest of generals in both experience and ability. He is most renowned for his military successes which he achieved at the expense of heavy casualties to his own army – the so-called “Pyrrhic victory”. However, while his career as a general and king was spectacular, he failed to fulfil the potential he promised. He fought against the rising power of Rome in southern Italy and in Greece against the Macedonian monarchs Demetrius Poliorcetes and Antigonos Gonatas. His career falls into three main phases: the establishment of his power in Greece (307–285 BC), his expedition in southern Italy (285–474 BC), and his return to and death in Greece (275–272 BC).

Pyrrhus, the son of Aeacides and Phthia, was born to a line that traced its ancestry back to Neoptolemus, son of Achilles. His career became wrapped up in the intrigues and intricacies of the early Hellenistic era known as the period of the successors. He became king of the Molossians in 307/06 BC while still only 12 years old when he was installed by Glaucias, king of the Illyrians, but he reigned for only five years before being expelled by Cassander in 302 BC.

In these early years Pyrrhus was embroiled in some way or other with Demetrius Poliorcetes, whom Deidameia, his sister, had married in 303 BC and with whom he sought refuge. In 302 BC he served as a lieutenant to Demetrius Poliorcetes and Antigonos Monophthalmus on what was to be the losing side at the Battle of Ipsus in 301 BC, but remained loyal to Demetrius, acting as caretaker in Greece.

In 299 BC Pyrrhus was handed over as a political hostage to Ptolemy I. He married Antigone, the daughter of Berenice and Ptolemy I, and with the support of Egypt and Agathocles, tyrant in Syracuse, in the early 290s BC he became co-regent of Epirus with Neoptolemus. He soon removed his co-regent and consolidated his Epirot kingdom. He founded a city named Berenice (modern Preveza) in honour of his mother-in-law. On his wife's death, Pyrrhus married Larnassa, daughter of Agathocles, and received the islands of Corfu and Leucas as a dowry. A series of additional political marriages secured further territory around Epirus.

Following his success against Demetrius Poliorcetes' lieutenant Pantauchus, Pyrrhus added territory to his kingdom. He was given the title “Eagle” by the Epirots and began to decorate his helmet with a high crest and goat's horns at the side. The rift between Demetrius – who had declared himself king of Macedon – and Pyrrhus was

widened by the death of Deidameia. In addition, Demetrius married Pyrrhus' estranged wife Larnassa, and took control of Corfu.

The rising power of Demetrius was met by the concerted efforts of Pyrrhus and other Hellenistic kings in the early 280s BC. Ptolemy sailed to Greece "to persuade the cities there to revolt", Lysimachus invaded the north of Macedonia from Thrace, and Pyrrhus attacked southern Macedonia (Verroia). The kingdom of Macedon was partitioned by Pyrrhus and Lysimachus, but Pyrrhus' successes were short-lived. The Aetolians shifted their support to Lysimachus, and Ptolemy ended his aid to Pyrrhus, who was forced to withdraw back to Epirus.

In 284 BC a request came from the people of Tarentum (and other Greek cities in Italy) to Epirus for help against Rome. Pyrrhus took up the invitation and fought for the cause of Greek cities in southern Italy. Early success at Heraclea with an army of infantry, cavalry, and elephants secured the support not only of Greek cities in Italy but also Italian tribes, the Bruttians, Lucanians, and Samnites. Pyrrhus then marched on Rome. Another victory was secured at Asculum in 279 BC, but again with some loss on the Greek side. Before he was able to consolidate these successes, he was distracted by another appeal, this time from the city of Syracuse in Sicily. There he fought in 278 BC the allies of Rome, the Carthaginians, and the Mamertines. In 276 BC Pyrrhus was recalled to southern Italy, was defeated by Rome in 275 BC, and returned to Epirus with a severely depleted army. He left a garrison in Tarentum but was never to return.

In Greece Pyrrhus embarked on a campaign in Macedonia in 274 BC before marching into the Peloponnese in 273 BC to respond to an appeal from Cleonymus. At Megalopolis he declared that he was fighting to liberate the Greek cities from Antigonos Gonatas, king of Macedon. His intentions are doubted by the ancient sources. Whatever Pyrrhus' plans, they were ended abruptly in 272 BC. During an attack on the city of Argos, he was killed: struck on the head by a tile thrown from the roof, he was beheaded by one of Antigonos' men.

Pyrrhus fought on behalf of the Greek cause for the cities of southern Italy and Sicily and had tried to liberate Greek cities from the king of Macedon, Antigonos Gonatas. At the time of his death he had established Epirus as a major power, and he had transformed Dodona into a major cultural outpost. However, his lasting legacy to Hellenic culture is his military exploits. His prowess as a military leader went before him, but his inability to secure victory without heavy losses has outshone his strategic and tactical expertise.

GRAHAM OLIVER

Biography

Born in 319 BC, Pyrrhus became king of the Molossians at the age of 12 but was expelled

by Cassander in 302. He served Demetrius Poliorcetes but in 299 was given as a hostage to Ptolemy I. With the help of Agathocles of Syracuse he became ruler of Epirus and founded Berenice (modern Preveza). In 284 he supported the Greek cities of south Italy against Rome but was defeated in 275. He died at Argos in 272 BC.

Pythagoras

Philosopher and mathematician of the 6th century BC

It is extraordinarily difficult to make any definite statement about Pythagoras, although he, and the philosophical tradition he founded, was clearly of the greatest importance in the development of Greek thought. He was born in Samos in the first half of the 6th century BC, son of Mnesarchus, a gem engraver. He moved to Croton in southern Italy around the middle of the 6th century, supposedly to escape the tyranny of Polycrates, and there formed a sort of society of followers (“Pythagoreans”), which involved itself in the politics of the Greek cities of Italy until there was a violent reaction, the Pythagoreans were massacred, and Pythagoras was driven from Croton; he died an exile in Metapontum. Nevertheless, there is clear evidence that in some places the Pythagoreans remained politically active in Italy well into the 4th century BC. The earliest reports represent him (sometimes in a negative sense) as a sage and wonderworker; he was reputed to have had a golden thigh, the ability to be in two places at once, and the power of prophecy. By the time that reasonably reliable reports become available (from the late 5th century BC onwards), he had already become a rather shadowy figure to whom a great variety of ideas could be attributed (and the situation is further confused by the reported practice of his followers of attributing all of their own ideas to him); Aristotle, who wrote an account (now lost) of Pythagoras, in his surviving works prefers to discuss “the Pythagoreans” rather than Pythagoras himself. Nevertheless, the fact that there was a group of

serious thinkers who called themselves Pythagoreans (e.g. Philolaus, who composed a cosmology of which fragments survive, and Archytas, who did impressive work in mathematics and harmonics) confirms that Pythagoras' contribution to the development of thought, whatever it was in detail, was substantial and fruitful.

The ideas attributed to Pythagoras fall into two quite distinct categories (and indeed some ancient writers believed that this meant that he had two different sets of followers). First, he is said to have to have been a religious teacher, whose doctrines were based on the idea that souls migrate to new bodies (both human and animal) after death, and that by observing a series of rules and prohibitions the believer may achieve a better reincarnation in future lives. The most notorious of these rules were vegetarianism and abstinence from beans, and among others mentioned by various authorities are not picking up things that fall from the table, not touching a white cock, and not breaking a loaf of bread; they were as inexplicable in antiquity as they are now, and various attempts were made to interpret them allegorically as containing philosophical and moral truths.

It is, however, for his supposed contributions to mathematics and science that Pythagoras is remembered today. He and his followers are credited with making a crucial contribution to the early development of Greek mathematics, but it is very difficult to say precisely what this was, since it is to non-Pythagoreans (such as Thales and Anaximander) that most actual mathematical developments are attributed; the story that Pythagoras discovered the famous proof of the proposition that the square on the hypotenuse of a right-angled triangle is equal to the sum of the squares on the other two sides, the so-called theorem of Pythagoras, is found no earlier than Plutarch, who wrote in the 1st and 2nd centuries AD quoting one Apollodorus as his source (Plutarch tells us that on making the discovery Pythagoras sacrificed an ox to celebrate), and it is probable that the proof most often used today was devised by Euclid (*Elements*, 1. 47) rather than Pythagoras. Aristotle reports that the Pythagoreans claimed that "things are number" (though he could not understand what they meant by it), and certainly number played an important part in the Pythagorean picture of the world. Pythagoras is said to have discovered that the concordant musical intervals are produced by strings under the same tension whose lengths are in simple numerical ratios involving the first four integers (1:2 produces the octave, 3:2 the fifth, and 4:3 the fourth). Whether or not this is true (the reports come only in late authors), it began a process of applying the principles of ratio and harmony to the structure of the cosmos. So, the first four integers, represented by dots and arranged in a triangle, and their sum, 10, were thought to have

special significance, and the Pythagoreans swore oaths by the *tetractys*, the diagrammatical representation of the relationships between these numbers in the form of an equilateral triangle. In some way, the generation of numbers, beginning with an original One, was the key to the understanding of the universe; the number of heavenly bodies was assumed to be 10 (because 10 was the perfect number), and their movement generated a musical harmony (which only the enlightened, like Pythagoras, could hear). Whatever Pythagoras' role in all of this, the idea that mathematics was fundamental to the universe, and that its study brought spiritual benefits, was undoubtedly a factor in encouraging the development of Greek mathematics beyond purely practical applications.

By the end of the 4th century BC Pythagoras had come to be regarded as the archetypical philosopher, and his supposed ideas had been incorporated into the mainstream of philosophy by the followers of Plato and Aristotle. We hear of very few philosophers who identified themselves as Pythagoreans, although preachers promulgating a popularized form of his religious ideas appear in new comedy. From the 3rd century BC onwards, however, he was sufficiently important a figure for a considerable number of forged documents to be produced under his name, a process that accelerated in the 1st century BC, when the school was refounded (the revived school is referred to by modern scholars as Neopythagoreanism, but is really a form of Platonism with a mathematical orientation); this later recreation and reinterpretation of Pythagoreanism makes the task of reconstructing the doctrines of the early school considerably more complicated. Later, with the rise of Christianity, Pythagoras became a sort of pagan counter-Christ, and Iamblichus' *On the Pythagorean Life* (4th century AD) presents him as a semidivine sage and miracleworker, to whom the philosophical basis of a challenge to Christianity could be attributed. Interest in him continues well into the Byzantine period, and much of our information on later Pythagoreanism depends on the work of Michael Psellos (1018–after 1081), to whom we owe the survival of most of Iamblichus' work.

Biography

Born in Santos in the first half of the 6th century BC, Pythagoras moved to Croton in south Italy in the mid-6th century. There he founded a society of “Pythagoreans” whose members were involved in the politics of Magna Graecia. His name is associated with religious teaching and important contributions to mathematics and science. He died in exile in Metapontum.

R

Religion

In attempting to describe Classical Greek religion, it is necessary to state at the outset that the Greeks themselves had no word to describe our concept of “religion”, no comparable conception of a sphere of life marked out from the “political” or the “secular”. Greek religion, moreover, did not – like modern Christianity – focus upon a set of dogmas or principles to which a man or a woman consciously chooses (or declines) to adhere. Nevertheless, even without a body of sacred texts, without an organized Church with the professed purpose of ensuring uniformity, the Greeks shared a roughly coherent set of beliefs and ritual practices that merit description together.

Greek religion was polytheistic. A core group of so-called Olympian divinities (those who were held in myth to live on Mount Olympus) was often numbered 12, but the identity of the 12 varied: the Parthenon frieze featured Aphrodite, Apollo, Ares, Artemis, Athena, Demeter, Dionysus, Hephaestus, Hera, Hermes, and Zeus. Though some of these divinities would have been familiar to all Greeks – Zeus, Demeter, and Hermes, for example – there was great variation both in the deities worshipped and in the relative emphasis given to different deities in different Greek cities and regions. Poseidon was associated particularly with the city of Corinth, Athena with Athens, Hera with Argos and Samos. Different cult titles or epithets were applied to divinities in different areas: Athena Polias (or “of the city”) in Athens or Zeus Lykaios (named after a local mountain) in Arcadia.

These relationships between cities and divinities were not exclusive or monogamous ones: Poseidon also held a central place in Athens, Athena in Sparta (even under the title “Polias”). Other local deities, however, such as the Arcadian goddess Despoina (or “mistress”) or the Spartan Helen (though they may have shared certain attributes, or even sometimes fused, with Panhellenic deities), were more or less restricted to particular localities. In addition, there were a large number of lesser divinities such as nymphs (believed to inhabit and somehow to embody rivers, trees, and mountains) and heroes. The latter, a particularly disparate group, included the Panhellenic Heracles (also worshipped as a god); mythological characters, for example from the Trojan War; and historical individuals worshipped after their deaths, such as the Spartan Brasidas, the antagonist in the Peloponnesian War of the Athenian historian and general Thucydides. In Athens, the city that is best documented, we know of the existence

of hundreds of heroes.

How are we to understand this confusion of deities? Were the Argive and Samian Hera, say, or the Spartan and Athenian Athena Polias, one god or two? The answer is probably that they were believed to be both different and the same. That the names of so many divinities, and the stories of their exploits, were common across the Greek world clearly means something, even if the devotees of a god's different cults were distinct. In his odes in honour of the victors of Panhellenic festivals, when a victor's home city possessed no cult of the Panhellenic deity in question, Pindar addressed himself to a different local manifestation of that god. In describing an instance of divine intervention, Herodotus will sometimes ascribe it at one moment to a named divinity, at another to a generalized divinity, "the divine", or "the god". A powerful principle in Greek religious thought was that the nature of the gods was fundamentally unknowable, and that the distinctions between divinities, and their characterizations through myth, were traditional, even arbitrary. Far from leading to widespread scepticism concerning the existence of the gods, this "uncertainty principle" seems, however, to have cushioned the individuated gods of myth and ritual from challenge.

The relationship between men and gods in Greek religion is often portrayed in modern accounts as more contractual than personal: the proper observation of ritual duties – especially of sacrifice, accompanied by prayer – was rewarded by good fortune in the form of, for example, a good harvest, the birth of children, or through negative blessings such as the absence of disease or a journey free of shipwreck. (The idea of personal salvation after death was not widespread, being limited largely to the mystery cults such as that of Eleusis.) Though a greater emphasis perhaps was given to ritual than in many other religious systems, the exchange was not quite so crudely commercial. In literature emphasis is often placed on the spirit in which propitiation of the gods was performed. A man's past actions may make his sacrifice unwelcome. Xenophon's account in his *Anabasis* of his journey into Asia with a group of Greek mercenaries, the so-called Ten Thousand, reveals also an extraordinarily warm piety.

Other differences between Greek religion and Christianity have also perhaps been exaggerated. The existence of sacred texts or an organized Church demonstrably fails to ensure more than a degree of uniformity in belief and practice. Though there was never in the Greek world any identifiable core set of beliefs to which adherence was demanded, there were limits to diversity and toleration: a number of prosecutions for impiety took place in the late 5th and early 4th centuries BC in Athens; the grant of divine honours to rulers such as

Alexander encountered opposition. Though we cannot talk in a Greek context of “belief” in the sense of a personal leap of faith, the reality of Christian belief reveals a number of similarities to Greek religion. Just as Christian belief in an everloving and just god must explain the appearance of injustice, so Greek belief in the gods’ unfailing response to propitiation must incorporate similar strategies for explaining exceptions. A similar pattern can be seen underlying other areas of Greek belief. The belief that gods punish unjust or impious actions – there was a considerable overlap between the ideas of the pious (*hosion*) and the just (*dikaion*) – is maintained by means of a number of such “let-out clauses”: that retribution may occur through human agency, that it may follow immediately or be delayed even for a number of generations, or that, while the divine is, in general, just, it may also be capricious. The Greek belief in the reliability of oracular prophecy (from shrines such as Delphi, Dodona, and Didyma) similarly relies on a number of explanations for prophecies that are patently never fulfilled: that the correct interpretation was not discovered, that undue influence had been exerted (or even that the priestess had been bribed), that the consultant at the oracle had committed some error in procedure, or that some prophecies are simply misleading or dud.

A consequence of the lack of a clear separation of “sacred” and “secular”, the lack of a distinction of Church and state, is that it is perhaps less easy to generalize on the political implications of Greek religion. A number of activities or aspects of life that we would casually class as secular were in the Greek world coloured or shaped by religious practices or beliefs. The political relationships between Greek cities were regulated through religion: when one city founded a colony, the flame for the sacred hearth of that colony was taken from its mother city; the relationship of colonizer and colonized was a relationship of religious duty. Treaties between cities, termed in Greek *spondai* (or “libations”), were marked by oaths sworn by the gods, accompanied by sacrifice: Thucydides records how in the Peloponnesian War the Spartans ascribed a number of military reversals to their breaking of a treaty. Many official aspects of city life – politics, the administration of justice – were touched by religion: as the comic playwright Aristophanes reveals through a parody, the assembly meeting started with a prayer. Oracles and prophecies were also clearly introduced into arguments in the assembly. Greek tragedy and comedy themselves were performed in the context of religious festivals such as the festival of Dionysus. Though there were professional oracle-mongers and diviners, priests never formed a separate caste in Greek society. Rather they were drawn from the population at large, sometimes by virtue of family, but increasingly by

election or by lot. The magistrates of Athens or the kings of Sparta performed functions that we would classify as a mixture of sacred and secular.

Religion was also central to the Greeks' perception of their identity in relation to foreign peoples and one another. The Greeks represented their gods as universal and found equivalents for them among foreign peoples, saying, for example, that Dionysus was the Greek name for Osiris or that the Ethiopians worshipped Zeus and Dionysus "alone of the gods". There was consequently no need felt to "evangelize" foreign peoples; for a Greek to proclaim a "war of religion", a crusade, was unthinkable. Herodotus describes as madness the action of the Persian king in mocking the rites of the Egyptians. Nevertheless, it is arguably no coincidence that such, often imaginary, religious crimes are ascribed to foreign peoples (so-called "barbarians") rather than to Greeks. Stories of the punishment of such actions are often reported with relish. Moreover, though they may have espoused an ideal of toleration of foreign practices, and though they may have thought most foreign gods had equivalents in the Greek pantheon, the line was drawn at common worship. Though the long-standing Greek god Dionysus was perceived as of eastern origin, genuine newcomers such as Adonis, Sabazius, Bendis, and Asclepius (from within the Greek world) were assimilated into the cult system of a city only with difficulty and some reluctance. Panhellenic festivals such as the Olympic Games were closed to non-Greeks. Those Greeks who settled in Egypt built their own temples: the Hellenion for common use and other shrines of Zeus, Hera, and Apollo for settlers from Aegina, Samos, and Miletus respectively.

As this last example demonstrates, the citizens of different Greek cities were conscious of their distinct religious identities. Just as the Olympic Games were barred to non-Greeks, so certain city festivals were barred to non-citizens. Citizens belonged, however, to more than one religious community: phratries (or brotherhoods – groups based on, at least perceived, common descent), tribes, demes (or villages), and families, all had religious rituals associated with them and all were doubtless the focus for some feeling of community.

Perhaps the hardest issue in the study of Greek religion is the assessment of change. During the 5th century BC there was a particular upsurge in religious scepticism: the development of natural, "scientific", explanations of disease or madness, observations of the injustice of the gods, that the gods were created as a form of social control, or that the belief in divination was a popular superstition. It is important, however, not to see scepticism on such issues as heralding a general or widespread reaction against religious belief. A certain degree of questioning and doubt was integral to Greek religion in all

periods. Many of these sceptical positions – the injustice of the gods, for example – were rooted in traditional attitudes. Such changes as occurred as a consequence of events – the failure of Athenian diviners during the Peloponnesian War, for example – were probably largely piecemeal. The Greeks to a large extent had prepared answers for such eventualities: most diviners are charlatans; not all forms of divination are equally reliable. There is no reason, or evidence, for supposing that such reversals sparked a general decline in divination or in religiosity. Perhaps the clearest changes in Greek religion occurred as a consequence of Alexander's conquest of the Persian empire. Not only were new gods such as Isis and Serapis absorbed, but the pattern of worship changed in response to new political realities: Greek cities came to terms with the powerful and distant rulers of the Hellenistic kingdoms, or with the growing power of Rome, by integrating them in their pantheons as gods.

Rhetoric

Rhetoric is commonly understood to have to do with persuasive speaking – when, that is, it is not thought of as verbal deception or coercion. It is important to realize, however, that rhetoric has a long and complex history as a discipline taught in schools and as a way of doing things with words in the public sphere.

As a cultural practice, the resolution of disputes and the formation of policy decisions by means of discourse can be traced back to preliterate Greek society, as is evident from numerous episodes in epic poetry, for example the assembly early in book 2 of the *Iliad* and the debate at the beginning of *Odyssey* 2. From these it is clear that there were strict conventions governing the conduct of debates, and of what was considered adequate and relevant evidence. From the mid-5th to the end of the 4th century BC, one can see the development in Athens of competing systems for the teaching and practice of speaking persuasively in court and in public assemblies, where institutional frameworks had been erected in the wake of judicial and political reforms. An old tradition has it that the teaching of rhetoric began in Sicily; but it is clear that the earliest significant lessons were given in Athens by two non-Athenians, the so-called sophists Protagoras and Gorgias. We see, next, in Plato's *Gorgias* and *Phaedrus*, a scathing critique of sophistic teaching, which, in Plato's view, would include that of Isocrates. Plato's pupil Aristotle composed a systematic treatment of rhetoric which takes issue with Plato and the sophists alike. During this same period, independently of the others, Anaximenes of Lampsacus composed another handbook, the *Rhetorica ad Alexandrum*. Its orientation is quite pragmatic, but its origins and intended audience are not clear.

Reduced to their basic elements, the rhetorics produced in Classical Greece differ from one another in important ways. The sort of rhetoric taught by Gorgias, so it seems from Plato's testimony and from the *Encomium to Helen* attributed to Gorgias, gave almost unlimited power

to the speaker, who used language as a means to condition the emotions of his audience to achieve its compliance. Plato, by contrast, allowed as legitimate only a rhetoric that communicated to its audience truth arrived at by means of dialectic. The rhetoric of Aristotle's *Rhetoric* is one based on a method of arguing from "what usually happens" – i.e. "probabilities" – using rhetorical syllogisms (*enthymemata*) to provide audiences with grounds for judgement on legal, political, and moral issues. For Isocrates, the teaching of rhetoric would produce eloquent speakers with the ability to bring about consensus (*homonoia*) among the citizens of the state. The Gorgianic and Platonic models are both unilateral and asymmetric, because the only function of the audience is to attend to the speaker. The Aristotelian and Isocratean models of the speech situation tend more towards a collateral relationship between speaker and audience; and it is the audience that provides the grounds for argument and makes the decisions. These four notions of rhetoric – all developed in the same place over less than a century – have persisted down to our own time, sometimes in competition with one another, with one becoming dominant at one time, another at another time.

Only Isocrates continued to exert any significant influence over succeeding generations in antiquity, and only in the context of a rhetoric curriculum that had been developed in schools all across the Greek world after the conquests of Alexander the Great as part of the standard programme of basic education, the *enkyklios paideia*. This curriculum, designed to train boys to succeed in a range of discursive activities from letter writing to diplomacy to the practice of political and forensic oratory, was the one inherited both by Cicero (see, e.g., *De Oratore*, 3. 23ff., 59ff., 86ff.; and *Epistulae ad Familiares*, 1. 9), who continued to dominate rhetorical education in the west until well into the 17th century, and by Hermogenes (d. AD 225), whose refined versions of it virtually defined rhetoric in the eastern, or Byzantine, tradition.

The school curriculum consisted of, first, a set of elementary exercises (*progymnasmata*) and, at a later stage, declamations on assigned questions, usually of a fictitious nature. The lessons that were inculcated and repeated performance aimed at producing "the good man skilled in speaking". The art, as it was taught, consisted of five parts: invention (the techniques for discovering arguments); arrangement (consideration of order and amplitude in making the argument); expression (deploying the techniques for composition and ornamentation); memory (techniques for remembering both one's own speech and the body of accepted opinions on every subject); and delivery (the rules for the control of voice and gesture). At the heart of the process of invention is the so-called *stasis* system, a methodical

way of determining the issue in dispute – is it the issue of fact, of definition, or of quality? – and of developing appropriate argumentative strategies. Students were taught a standardized format for speeches, usually based on a conventional courtroom argument, that consisted of the exordium (in Greek, *prooimion*), or introduction; the narration (*diegesis*); the argument (*pistis*) and refutation (*lysis*); and the peroration (*epilogos*). With minor variations, this standard format persisted in school rhetorics, in both the Latin and Greek traditions, throughout late antiquity, the Middle Ages, and the Renaissance.

To the school curriculum, Cicero (or perhaps his rhetoric masters) added a philosophical dimension borrowed from Academic scepticism as taught by Carneades, the idea that, in the absence of certain knowledge, it is necessary to be able to produce the arguments on both sides (*in utramque pattern*) of an issue. An issue addressed by this “multivoiced method” (*multiplex ratio dicendi*), *controversia*, is resolved only in so far as one decides to adopt one of the positions in conflict as having more *probabilitas* or to modify it or to formulate a new position. It is precisely this method that Cicero uses in *De Oratore* and in such philosophical works as *De Natura Deorum*. As with Isocrates, “philosophy” is assimilated to rhetoric.

The persistence of the Isocratean–Ciceronian tradition in the west is evident in such works as Augustine’s *De Doctrina Christiana* (completed c.ad 325), the last book of which is devoted to the principles of eloquence in a Christian setting; the brief dialogue on rhetoric composed by Alcuin (c.800); and the many handbooks on preaching, letter writing, and poetic composition that were in circulation during the later Middle Ages. In the east we find the tradition of Greek eloquence as defined by the likes of Isocrates and Demosthenes and systematized by Hermogenes in the productions of the so-called Second Sophistic, the works of Church Fathers, and in Byzantine diplomatic and court literature up to the fall of Constantinople in 1453.

Rhodes

Island in the Dodecanese

The largest of the Dodecanese group of islands, Rhodes lies in the eastern Aegean a few miles off the southwest corner of modern Turkey. Habitation on the island extends back as far as the neolithic period, and pre-Greek and early Greek settlements are attested in the 2nd millennium BC. The Minoans, a highly civilized seafaring people from Crete, had founded a trading post at Trianda (on the west coast about 9 km south of modern Rhodes town) by the 16th century BC, and the Mycenaean Greeks who succeeded the Minoans as the main power in the Aegean appear to have established prosperous colonies on the island some two centuries later, judging from the presence of chamber tombs and rich finds from the cemetery near Ialysus (not far from Trianda).

After the collapse of the Mycenaean civilization, the Dodecanese islands were inhabited in the so-called Dark Age of Greece by Dorian-speaking Greeks emigrating eastward from mainland Greece. The island had various names in antiquity, but finally “Rhodos” (in Greek) became standard. Mythological legend held that Rhodos was the child of the sun god Helios and the nymph Rhoda. Other traditions associated it with the Greek word for rose, *rodon* (whether or not this etymology is true, the rose appeared as a symbol on Rhodian coinage in the Classical and later periods, and Rhodes is popularly known as “the Island of Roses” in modern times). Three city states were founded: Ialysus (see above), Camirus (also on the west coast some 35 km south of Rhodes town), and Lindus (about halfway down the east coast). These three cities are mentioned in the Homeric Catalogue of Ships as sending ships to the Trojan War (*Iliad*, 2. 656).

The cities flourished in the 7th–6th centuries BC and, like many other cities in archaic Greece, sent out colonies (Lindus founded Phaselis on the east coast of Lycia c.690 BC, and, in association with Cretans, Gela on the south coast of Sicily in 688 BC). The cities on Rhodes were on

the whole ruled by tyrants from local aristocratic families. The most famous of these was Cleobulus of Lindus in the early 6th century BC, who was one of the “Seven Sages” – men renowned for their wisdom in political and practical matters – in Greek literary tradition (an impressive round structure on the headland just north of Lindus is traditionally known as the tomb of Cleobulus, but it is of pre-Hellenic date).

Rhodes was caught up in the political situation affecting the rest of the Greek world in the 5th century BC. In common with the rest of east Greece, the island became subject to the growing power of the Persian empire in 490 BC. After Greece – under the leadership of Athens – finally defeated the Persian empire in 479 BC, the cities of Rhodes, like most of the other Greek cities, joined the Delian League, a confederation of cities which paid tribute to Athens in return for protection against a possible new Persian threat (all three cities of Rhodes are recorded in the Athenian Tribute Lists). The Rhodian cities remained under Athenian influence until they revolted in 412/11 BC during the Peloponnesian War and switched their allegiance to Sparta. The revolt is often attributed to the encouragement of a prominent aristocrat from Ialysus named Dorieus, who had been exiled by Athens some years previously and had turned to Sparta.

The most important political event in the history of ancient Rhodes occurred in 408/07 BC, when the three independent city states formed a single community and founded a federal capital city, also called Rhodes, at the north tip of the island. The three old cities thereby lost their independent status, and together formed a single political unit run by federal officials and legislative bodies. The reasons for this dramatic political rearrangement are not known, but an economic motive seems likely. Rhodes island occupied an ideal position between east and west, and a city at the northern tip of the island provided easy access to both seas. The economic prosperity of Rhodes in years to come proves the wisdom of the synoecism. The old cities continued to be inhabited, had local governments, and controlled their own local religious cults, but, from now on, the capital city of Rhodes controlled the federated island's foreign policy.

The political life of Rhodes in the 4th century BC is complex. A revolt from Sparta in 395 led to the return of Athenian influence, despite continuing internal unrest, and within the next decades to the establishment of a democratic government which was the hallmark of Rhodes throughout the rest of its independent life. It was during the 4th century that Rhodes consolidated overseas territory and incorporated it into the Rhodian state. This consisted of the so-called *peraia* (“the land opposite”), the area of southwest Turkey immediately opposite Rhodes, as a result of which Rhodes gained a

firm foothold in Asia Minor between Caria and Lycia. Various nearby islands were also incorporated (Chalki, Symi, Tilos, Nisyros, Karpathos, Kasos, and Megiste [Kastellorizo]). As an Athenian ally, Rhodes joined the Second Athenian Confederacy in 378/7 BC, but the growing influence of the Persian satrap Mausolus of Caria upset the political equilibrium in the eastern Aegean. His meddling led to the "Social War" against Athens in 357, and the consequent emancipation from it of several former allies, including Rhodes. Nonetheless, Rhodes remained under the domination of Caria until the arrival of Alexander the Great in 332. The island submitted to the conqueror, and its "liberation" from Persian influence consisted in the installation of a Macedonian garrison whose removal after Alexander's death was a cause for celebration.

Alexander's conquests and the activity of his successors created the conditions in which Rhodes was to thrive. The foundation of Greek cities in the new Hellenistic empires transferred the centre of trade to the east. The new trade routes converged on Rhodes, and it rapidly became the chief commercial entrepot of the Levant, with consequent enormous economic prosperity. Furthermore, Rhodes managed to maintain its system of democratic government and independence even in the face of the warring Successors.

When the Successors Ptolemy of Egypt and Antigonus Monophthalmus were engaged in a power struggle in the eastern Aegean, Rhodes refused to join Antigonus against Ptolemy, thereby preserving its alliance with Egypt (Antigonus was interested in Rhodes because of its naval capacity – a considerable navy, impressive harbour installations, and shipbuilding timber). This was the occasion which led in 305/4 BC to the famous year-long siege of Rhodes by Antigonus' son Demetrius, who was to receive his nickname "Besieger" (in Greek, "Poliorcetes") as a result of this action; the siege is vividly described in Diodorus Siculus, 20. 82–88, 91–100. Demetrius did not take Rhodes despite ferocious assaults by land and sea, and in thanks for their salvation the Rhodians erected a 33-m-high bronze statue of their patron god Helios which was paid for from the sale of Demetrius' abandoned siege equipment. The Colossus of Rhodes was one of the most famous statues of all antiquity and was reckoned as one of the seven wonders of the ancient world. It stood until toppled by an earthquake in the early 220s BC.

In the first half of the 3rd century the friendship between Rhodes and Egypt was the mainstay of Rhodian policy and responsible for its rise to pre-eminence in both the political and commercial spheres. Under the benevolent eye of Egypt, Rhodes began to play an active role in the Aegean, beginning its crusade against the marauding pirates who threatened economic stability. Rhodes kept the pirates

contained through special naval techniques, and this activity enhanced its prestige and the confidence felt towards it by seafaring communities.

Some time around the middle of the 3rd century, Rhodes appears to have distanced itself politically from an Egypt which had suffered loss of face on land (in the Chremonidean War) and sea (at the battles of Cos and Andros) at the hands of the Antigonids. For the rest of the 3rd century Rhodes stands on its own feet as the paramount Aegean power, stepping into the position of naval supremacy vacated by Egypt. At the same time these political differences do not seem to have led to a rupture of commercial relations between Rhodes and Egypt, since these ties were economically essential to both. Rhodes continued to win for itself the recognized position as protector of the island communities, and this was achieved when it refounded the “Nesiotic League” (“League of the Islanders”) by the end of the 3rd century. The earthquake of the early 220s which toppled the Colossus (see above) also destroyed much of the ancient city. Significantly, all of the Greek kings of the east and west contributed lavishly to the cost of reconstruction, and even assisted in money and kind for the rebuilding of the Rhodian fleet – a sure sign of the high prestige and pacific intentions of the independent democracy at the time.

At this period Rome began to interfere in Greek affairs, and Rhodes was an active Roman ally in the wars against the Macedonian Philip V and the Seleucid Antiochus III. As a result, the Treaty of Apamea in 188 BC rewarded Rhodes with the possession of Caria and Lycia. Internal dissension between the pro- and anti-Roman factions within Rhodes led to political equivocation, for which Rhodes paid the price in the aftermath of the Third Macedonian War when it was deprived of Caria and Lycia. It was further punished in 167 BC by Rome’s declaration of Delos as a free port, which gave Rhodes overwhelming competition as the centre of transit trade in the Aegean. Rhodes finally became an ally of Rome in 164 BC, thereby ending its political independence. From then on it shared the consequences of Roman intervention in the east, notably the Mithradatic War of 88 BC, and the Roman civil wars of the second half of the 1st century BC.

Ancient Rhodians famous for their cultural achievements include the 2nd-century BC Stoic philosopher Panaetius and his pupil Posidonius (a Syrian granted Rhodian citizenship); the sculptor of the Colossus of Rhodes, Chares of Lindus, a pupil of the great Greek sculptor Lysippus of Sicyon; and the 3rd-century BC epic poet and author of the *Argonautica*, Apollonius Rhodius (who may have been a native of Alexandria who settled in Rhodes).

Roman Period 31_{BC}–AD 330

Long before Roman political control of Greece began in the 2nd century BC, contact between Greece and Rome had already wrought cultural and economic changes in both regions. Scholars have found evidence of a Greek presence in Italy from as early as the Mycenaean era and throughout the period of colonization in the 8th and 7th centuries BC. Within 50 years of colonizing southern Italy and Sicily (Magna Graecia), Greek communities began to engage in a flourishing trade and an exchange of ideas with the Italians. The Romans adopted some Greek gods, their temples took on aspects of Greek architectural styles, Greek artisans produced pottery for the Italian market, and Greek historians wrote about the origins of the Italians and Romans. Writers such as Timaeus made genuine efforts to understand the history of Italy, in light of the growing power and influence of Rome. While these writers tended to Hellenize Roman history and origins, their views were accepted by the Romans themselves.

Gradually there began a fusion of Greek and Roman cultures. The Romans entered into more formal relations with the local Greek city states, while the mainland Greeks became actively involved in conflicts in Magna Graecia. The merging of Roman and Greek politics and culture began in earnest with the military interference in Greek affairs by the Romans, in particular during the Achaean War (146 BC). After the Achaean War Corinth was levelled, vast amounts of booty were shipped to Rome, the men were massacred, and the rest of the

inhabitants sold into slavery – leaving the once bustling town empty and in ruins. The events that followed this war are unclear, but over the course of the next century these events slowly reshaped the Hellenistic east into provinces of the expanding Roman empire, and Greek city states into Graeco-Roman municipalities.

This contact, while certainly important politically and economically, at first had only limited influence on the essence of Greek civilization. The Greeks themselves, and the Romans too, had a profound respect for the language, literature, and culture of the Hellenic world, which would remain unshaken by political conquest, devastation by Roman legions, and economic turmoil of the 1st century BC. Elite Romans continued to send their sons to Greece for the finishing touches on a proper education. Cicero and then his son went to Athens, as did Ovid and Horace – who saw that Greece had captured its captors ('*Graecia capta ferum victorem cepit et artis intulit agresti Latio*' [*Epistulae*, 2. 1. 156–57]). Colonies of veterans were founded, especially by Julius Caesar and Augustus, some nine or ten in Greece, and included the revival of cities such as Patras and Corinth. Yet these colonies were quickly assimilated to Greek culture, and the Greek language superseded Latin. Indeed, the administrative language in the east generally was Greek; edicts and legal proceedings were in Greek. The eastern legions were largely recruited from among the Greek-speaking peoples. Roman citizenship remained rare in the Greek east (until AD 212 when Caracalla proclaimed the *Constitutio Antoniniana*), and only a few citizens were created by their enrolment in these legions.

This is not to say that no Romanization occurred. Greek art, which the Romans greatly admired, was influenced by Roman patronage. The Romans showed their affection for things Greek both by carrying off treasures to Italy and by buying copies of the Classical and archaic works that were in vogue. But the Romans also controlled the economic life of Greece by providing a market and consumer demand thus dictated artistic output. Among the distinctive forms of Roman art was realistic portraiture, rather than the pure idealization found in Greek art. New subjects were explored by Greek artists as a result of Roman interest in recreating a strong sense of psychological reality. Stricter realism was appealingly combined with an attempt to convey character. Common themes investigated youth and age, hermaphrodites, groups suggesting a complex set of emotions (e.g. the *Laocoön*), or physiological studies (e.g. the *Belvedere Torso* and the *Boxer*).

During the principate, Roman building techniques were widely adopted in Greece (for example, in the use of fired brick and brick with mortar construction, as well as, occasionally, podium-style temples). Other Roman amenities, such as baths, became a common

feature of any well-appointed Greek town, while mosaics, wall paintings, marble revetments, and Roman-style garden sculptures became an integral part of costly homes and public buildings. For reasons of both economy and an archaizing spirit, reuse of architectural materials was common throughout the Roman period (for example, 12 unfluted Ionic columns were brought from the temple of Athena at Sunium for use in Athens for a podium temple in the Agora).

Since Greece had lost its ability to compete through war, the centuries of Roman rule provoked a new competitive spirit. Abandoning the old political rivalries, cities were now transformed by cultural battles. Citizens strove to build ever more beautiful buildings, and, with Roman direction and encouragement, they offered expensive prizes to their victors in the Panhellenic games. During the 2nd and 3rd centuries AD Achaëa held a privileged position in the world of these athletic competitions. Celebrating such contests in the Greek manner became a popular pastime throughout the Graeco-Roman east. The games were expanded and an elite circuit of festivals was established that included the four ancient Panhellenic festivals, as well as newer games such as the Asclepian games at Epidaurus, the Olympia Commodea at Sparta, and at Athens the Panhellenia, the Olympia, and the Hadriana. Other popular games, off the most common circuit, were found at Sparta (the Urania) and in Boeotia (the Eleutheria at Plataea, Trophonea at Lebadea, and Heraclea at Thebes). Regional games also existed and, though these were locally popular, they tended to have fewer out-of-town visitors and very small prizes (such games included the Gorgas festival at Ambryssus and the Euryclea at Sparta). Nearly every city had its own gymnasium where the young men could train for the games.

Likewise drama, music, and even religion provided an arena for competition, not only through the building of temples and theatres, but also through the professionalization of actors, singers, and poets, who toured throughout their regions. Religious festivals generally became elaborate affairs, particularly with the introduction of popular new cults into the Graeco-Roman world. The mystery cults of Isis, Mithra, Judaism, Christianity, and the imperial cult of Roma and Augustus were among the most common of these. The imperial cult was, of course, also a means to express loyalty and support for the rulers of Rome. This cult was introduced very early in Greece; for example in Athens the cult was founded in 27 BC. In fact, religious fervour seems to have been on the rise throughout the Graeco-Roman world and can be seen even in philosophical movements such as Neopythagoreanism and Neoplatonism, both of which evoked strongly emotional and spiritual reactions. Cities also demonstrated their

importance through their support of education: higher education was paid for out of public funds and even smaller cities had teachers on salary.

Many Roman emperors showed an active interest in Greece (sometimes, of course, this meant despoiling Greece of its art and antiquities). Pausanias reports that Claudius restored to Greek cities the artworks and statues that his predecessor Caligula had looted. He also remodelled the entrance way to the Athenian Acropolis. Nero was a devoted and active Philhellene. He spoke Greek, attempted to cut a channel through the isthmus of Corinth (to improve communications and trade), and he declared Achaëa free at the Isthmian Games in AD 66/67, though this status was overturned by Vespasian only a few years later.

While the emperors clearly felt it their right to remove whatever objects from Greece they wished, imperial dedications to Greece could be substantial, including buildings, roads, and other physical manifestations of their concern for Achaëa (as well as concern for their own prestige). The Flavian and Trajanic ages particularly marked an increase in both local and imperial benefices to Greek cities. Trajan built the Library of Pantaenus in Athens and instituted a competition in Sparta for the “best citizen”. Sparta’s competition relied on a citizen’s “love of honour” and the prize was the right to take over the city’s costly liturgical offices in a generous way.

Some Roman benefits had a profound effect on the appearance of Greek cities. Among the most dramatic of these was introduction of the colonnaded street – broad avenues flanked by matching porticoes and often paved in marble (such as at Athens and Corinth). Hadrian supported numerous costly projects including buildings at Delphi and many structures in Athens – transforming and restoring Athens in the process (Hadrian’s Library in Athens was closely modelled on the temple of Peace in Rome and helped to create a new sense of space in the centre of one of Greece’s oldest cities). The emperor also had constructed stoas, temples, aqueducts, bridges, and baths throughout the province of Achaëa. Private benefactors participated in such largesse as well. One of the most famous of these was the wealthy Athenian, Herodes Atticus. A Sophist, Roman senator, and a friend of Hadrian’s, he used his wealth and power to beautify Greece (for instance, he built a music hall and stadium in Athens, replaced statues at Olympia, and remodelled a music hall in Corinth).

In 131/32 Hadrian founded the “Panhellenion”, an organization of Greek cities (from Greece, Asia Minor, and north Africa) centred in Athens. By creating this organization he implicitly joined himself to the traditions of Classical Greece and the legends of Athens’ founder, Theseus. Hadrian’s behaviour was set neatly within a cultural context

that generally idealized and tried to revive the Greek past. A specific feature of this 2nd-century Greek revival was known as the Second Sophistic, a movement in which Sophists, or teachers of rhetoric, sought a public reputation. References to the past were central to their approach and were integral in their performances. Most Roman elites, even many of the emperors, had been schooled by such rhetoricians. Thus, rhetorical and philosophical schools flourished in many Greek cities, including Athens and Sparta. (Marcus Aurelius eventually endowed philosophy chairs in the cities of Achaëa, in part because of the respect instilled by his own training.) This education and the fairly common activity of tourist travel to Greece – a fashion encouraged by Hadrian's own travels in Greece – combined with the foundation of the Panhellenion, created a climate favourable to merging both the "Greek past and the Roman present". This lively and pro-Greek atmosphere, though archaizing, benefited Greece both materially and intellectually. Roman respect for Greece and its traditions lasted well into the 3rd century AD.

At the same time, Greek elites were beginning to infiltrate the Roman aristocracy, by being admitted increasingly to the senate and equestrian classes. Local elites continued to play important roles as Roman administrators and representatives. These men formed a part of the empire's governing body. This is not to say, however, that the Greeks accepted Roman authority without resistance. Revolts erupted periodically throughout the period of Roman rule into the 2nd century AD. Indeed, a small abortive rebellion occurred even under the relatively benevolent rule of Antoninus Pius. Less overt forms of resistance were also present in Greek behaviour through, for example, continued local control of religious icons, rituals, and sacred space.

The late 2nd and 3rd centuries AD brought unwelcome changes to the entire Roman world. Civil wars, economic woes, migrations, and invasions from the north characterize this era in Graeco-Roman history. The needs of the imperial treasury increased economic and material demands on the provinces. Ambitious building projects and artworks were neglected in favour of defensive structures and strategies, especially since the northern peoples were no longer held back at the borders of the empire, forcing the Greeks to defend themselves from invaders such as the Goths in AD 262 and the Heruli in AD 268 (these latter were expelled by the Philhellene emperor Gallienus). According to tradition, the Herulians destroyed nearly every building in Athens (except perhaps the area around the southern slope of the Acropolis). These attacks did leave tangible remains, both in the numerous destruction layers of Greek towns, and in the visible response of the inhabitants of Greece. The citizens of the unarmed province of Achaëa, Zosimus recalls (1. 29. 3), fell into a panic at first,

but evidence also suggests that inhabitants fought the invaders off and then, in some regions, hurried to restore and/or build fortifications both in urban areas and on the frontiers. An inscribed poem in Athens records this building effort after the Herulian attack: “As Amphion raised the walls of Thebes by the music of his cithaera so now do I, Illyrius, follower of the sweet voiced muse build the walls of my native city.” Claudius Illyrius was the governor of Cyprus and was honoured with statues on the Acropolis of Athens, perhaps for the gift of walls to his native city.

Upon Diocletian’s accession to the throne, the empire was temporarily at peace and the emperor set about solving the more serious economic and social problems in the provinces. Some regions in Greece enjoyed a brief building boom, but when he stepped down, conflict began again, and the Balkans, Greece included, became a recruiting ground for Constantine’s civil war with Licinius. Constantine, once in power, moved his capital to Byzantium, “New Rome” or Constantinople. In deference to Greece’s illustrious past, Constantine encouraged another revival of Greek letters and renewed support for educational institutions after the hiatus of the civil wars. Thus, during the early 4th century Achaëa generally saw a renewal of building and literary activity, rejuvenation in the decorative arts (Christian sarcophagi were the medium of some of the best sculptural artists of the times), and an invigorated economy. Nevertheless, in the tradition of earlier emperors, Constantine felt it his right to remove art and artefacts from his provinces, including Achaëa, to beautify his new capital. Despite the emperor’s respect for Greek traditions, and his desire for its art, there was a widespread decline in the dominance of Hellenic culture among the Latin ruling classes. The court at Constantinople, for example, was predominately Latin-speaking, forcing ambitious Greeks to learn Latin and Roman law in order to get ahead. Increasingly too, after the 4th century, Greeks became Christianized. Hellenic political, religious, and economic orientation turned east and thus began the transition in earnest to the later Roman empire, or early Byzantine era, in Greek history.

Romania

Romania is situated on the western shore of the Black Sea at a point where routes from Central Europe to the east and southeast converge. Its southern and southwestern frontier is marked by the Danube (ancient Istrus); its western and northwestern frontier extends far into the Hungarian plain; and its northeastern boundary is the Prut river, although from time to time it stretched to the Dniester by the incorporation of all or part of Bessarabia. Dobrudja abuts its Black Sea coastline, and this too has been attached to the core of modern Romania – the principalities of Moldavia and Wallachia – within varying boundaries at different times. The Carpathian mountains cut

an arc through the country from northeast to southwest, separating those parts long under the influence of Constantinople and those which, looking to the Black Sea from Transylvania, the Banat, and Maramures, belong to the Danube basin and formed part of millennial Hungary before 1919.

The territory of modern-day Romania has been populated from the Palaeolithic period. The country's historical period begins in the 9th–8th centuries BC and is connected in southwestern Europe with the so-called Thracian Hallstatt period (c.600–550 BC), which corresponds to European Hallstatt C. Basarabi culture is considered the most representative of this new period within Romanian territory: the population was formed of mainly agricultural tribes living in fortified or open villages whose dwellings were constructed of timber.

The middle Danube was populated by the Tribali, a Thracian tribe, and Dobrudja by the Crobyzi and Getae. In Dobrudja the assimilation of the Getae and other Thracian tribes by the Dacians (from the second half of the 6th century BC) led to the creation of a Geto-Dacian culture. In addition to these tribes, Scythians inhabited both Dobrudja and Transylvania, introducing certain types of iron weapon, contributing to the development of art, and bringing certain features of Greek civilization to Transylvania. Greek influence reached the Geto-Dacian peoples more directly – via Greek colonies established on the Romanian Black Sea coast. The lands south of the Carpathians have yielded very fine examples of metalwork (helmets, greaves, goblets and other vessels, and a gilt rhyton), decorated mainly with zoomorphic figures, although human figures and floral and geometric ornament are not entirely absent. Some of these objects may have come from native workshops (Thracian or Getic); most, however, are from Asia Minor or the Pontic region, or are of Persian workmanship.

Histria was the first Greek colony on the Romanian Black Sea coast. It was founded by Milesians in the last quarter of the 7th century BC at the mouth of the Danube, and named accordingly. In the archaic period it was a small settlement of modest wattle-and-daub houses, surrounded by defensive walls. From the Classical period it grew: stone temples were built in the city's sacral area; stone dwellings were constructed, many with fine masonry, some with an upper storey; and the city minted its own coins. Histria became the centre of Hellenic culture in Getic lands. It was a centre of trade through which Greek goods penetrated deep into the hinterland. Its agricultural territory (*chora*) was populated by local people, who also formed a small part of the city's own population. In the Hellenistic period Histria doubled in size; new city walls were built, as were new temples. In the Roman period the city was enlarged further and yet new city walls and new temples were built. It remained a craft and trade centre until its

destruction in the 4th century AD.

Another two Greek colonies, Tomis (modern Constanta) and Callatis (modern Mangalia), were established on the Romanian coast. Tomis, Ovid's place of exile, was established, also by Milesians, at the end of the 6th century BC. Excavation is very difficult, as the modern city lies directly above the ancient settlement; chance finds, however, demonstrate that it was an important craft and trading centre. In the Roman period it was decorated with marble sculptures, and mosaics were also found there. Callatis was established by Heraclea Pontica, itself a Dorian colony on the south coast of the Black Sea. Archaeological material and inscriptions demonstrate that Callatis, sited in a fertile cereal-growing region, was a prosperous city.

At the end of the 4th century BC the Celts entered Transylvania, bringing with them a more advanced iron-working technology and the potter's wheel. Celtic tombs in this area contain fine metal objects and pottery. North of the Carpathians Celtic influence played a role of similar importance to that of the Greeks in the southern and eastern regions.

Under Greek influence the Geto-Dacians minted their first coins in the 3rd century BC, imitating those of Philip II and Alexander the Great. Assimilation of the different tribes and cultures was gradually completed. A similar process affected Scythians of the Dobrudja, who exacted tribute from neighbouring Greek cities in exchange for military protection: by c.ad 100 they had disappeared, the memory of their presence retained in the Roman name for Dobrudja – Scythia Minor.

In c.80 BC Burebista established the kingdom of Dacia and became its first ruler. Dacia reached its peak under King Decebalus, who fought against the Romans. The second Dacian War (ad 105–106) brought about the destruction of the Dacian kingdom and Roman conquest of the entire region. The importance of this to the Romans is shown by the erection of Trajan's column (*Tropaeum Traiani*) at Adamclisi in AD 109; this, the most important Roman monument on the lower Danube, depicts scenes of Roman victory in the war. Trajan made Dacia a Roman province. Because of its strategic importance, an outpost of empire in the hostile region north of the Danube, it was placed under direct imperial authority. Three legions reinforced by various auxiliary troops, a force of some 50,000 men, were permanently stationed there. Here Roman culture had a clearly military character. New Roman cities (such as Sarmizegetusa, Apulum, Napoca, and Drobeta) were established, as well as military settlements. The Danubian *limes* was strengthened by the construction of fortresses at such points as Axiopolis, Carsium, and Capidova. New cities (*Tropaeum Traiani* and *Troesmis*) were also founded in Scythia Minor.

The province of Dacia, extremely hostile to the Romans, could be held against frequent invasions by aggressive neighbours only at enormous cost in terms of money and manpower. In 271 the emperor Aurelius decided to evacuate the province. This led to a cultural retreat and Dacia's return in the 4th century to its old agrarian lifestyle.

Rome

Largely through Magna Graecia, Greek influence on Roman life began to be felt at least as early as the 5th century BC. The *Sibylline Books* early acquired importance: kept beneath the temple of Jupiter Optimus Maximus, they are first recorded as being consulted in 496 BC. The cult of Apollo was introduced to Rome in 431 BC, and his oracle at Delphi was consulted in 398. As Rome's empire expanded, contact with the western Greeks increased; Greek art – particularly statues – arrived in large quantities on the capture of Syracuse, Capua, and Tarentum (211–209 BC).

Extensive Hellenization, however, began mainly in the 2nd century BC and chiefly as a result of Roman military conquest of the east, climaxing in Perseus of Macedon's defeat at Pydna in 168 BC and the sack of Corinth in 146 BC. More works of art came to Rome. (Polybius reports that in 146 Roman soldiers used Corinthian paintings as gaming boards, but more often captured artefacts were reverently or ostentatiously displayed in temples, villas, and public buildings.) Whole libraries also came: Aemilius Paullus took Perseus', and in the 1st century victors' spoils included libraries which had once belonged to Aristotle and Theophrastus; Pompey brought the medical works collected by Mithridates. And also, most importantly, there came the Greek personnel – refugees, political detainees like Polybius, educated slaves, many of whom were later manumitted – who could organize libraries and give instruction at all levels in Greek language, rhetoric, and philosophy. Other visitors who whetted an appetite for such

learning included Crates of Mallus, who lectured in Rome probably during the 160s, and the three philosophers who came as ambassadors from Athens in 155 BC. The presence of such figures contributed to an already strong Greek element in Roman education; increasingly in the 1st century BC Latin equivalents to Greek teaching materials were produced, but the principles remained Greek and knowledge of the language from an early age continued throughout the Roman period to be regarded as essential for members of the ruling class. (In literature Greek influence was also pervasive, as for instance in Plautus' adaptations of material from New Comedy in his plays.)

Some prominent Republican Romans were evidently philhellenic: for example Aemilius Paullus (d. 160 BC) and his son Scipio Aemilianus (185/4–129 BC), friend of Polybius. On the other hand Cato the Censor (234–149 BC) was one of those who publicly associated Hellenization with moral degeneracy, and the stereotype of fickle, unreliable Greeks – used on occasion for forensic purposes, for instance, by the otherwise generally philhellenic Marcus Tullius Cicero (106–43 BC) – remained commonplace into imperial times. But even Cato was fearful only, according to the usual modern view, of excessive Hellenization; he was himself well versed in Greek literature. By the 1st century BC Hellenism had clearly acquired an irresistible momentum. (On the other side, it seems to be in the late Republican and early imperial centuries that the double meaning of *Rhōmē* in Greek – Rome and strength – gave the city, and increasingly the cult of the goddess Roma, as Erskine has suggested, “a special aura in the eyes of the Greeks”.)

Under the principate (as often earlier) it is not always possible – or profitable – to separate Roman and Hellenic elements in Roman culture. But there are some episodes and periods where one can be more specific. Augustus' rebuilding of Rome relied heavily on Greek expertise in working with marble and Athenian craftsmen in particular led the “neoclassical ‘purification’ of architectural decoration” (Torelli, 1996). Some of the most evidently Hellenic work was for Gaius Sosius' restoration of the temple of Apollo in the Circus Maximus. Nero indulged in public, in Rome as in Greece itself, in Greek athletics and singing to the lyre. The notably philhellene Hadrian (whose early nickname *Graeculus* indicates that resistance to such immersion was not yet dead) introduced many Greek elements into the decoration of his villa near Tibur (Tivoli) and brought a fresh wave of artists from the east to work there and on projects including the temple of Venus and Roma in the Forum Romanum. At the same time the status of non-Italians was changing: senators with origins in the Greek east, occasionally admitted since Augustus' day, were numerous by the reign of Trajan.

S

Sacrifice

Thought to be an important means of communication between divinity and mortals, sacrifice is a central feature of religious practice. In antiquity, although animal sacrifice was predominant, the offering of fruit and vegetables was also considered to be sacrifice. The mythological *aition* (origin) of the idea of sacrifice is believed to be the story of Prometheus in Hesiod's *Theogony* (521–616). Prometheus, representing mortals, hosts a dinner at Mekone (Sicyon) and purposely deceives Zeus by assigning for him a good-looking portion that consists of nothing but bones. There are references to sacrifice throughout ancient Greek literature, and with the help of archaeological finds such as vase paintings and votive reliefs we are able to reconstruct approximately what went on. The sacrifice probably consisted of three stages. There was a procession that led the animal to the altar, and a purification ritual in which the animal's head was cleaned with water and sprinkled with barley grain. Then followed the cutting of the throat, and finally the burning of the meat. The gods' portion was bones covered with fat; then the entrails and the meat were given to the participants for consumption. The entrails were observed by the priests because their condition was supposed to provide omens. That is why sacrifices were often made at critical moments in mythology as well as in history, before mounting an expedition or taking an important decision. Most cults and festivals (such as the Dionysia, the Bouphonia, and the Eleusinian mysteries) involved some form of sacrifice. Besides the official celebrations in honour of a god or goddess, where sacrifice plays a central role, sacrifices were made at major events in private life, such as marriage, childbirth, death, and were often accompanied by libations. Sacrifices could be organized at various levels, by a city, a deme, a family, or an individual. Young people of both sexes would offer sacrifices to Artemis before they got married. Pindar tells us about fireless sacrifice (*Olympian*, 7. 47). Burned sacrifices were believed (Philostratus, *Eikones*, 2. 27) to have first appeared in Athens, where they were conducted gloriously. The altar was the site of the sacrifice. The Classical Greek altar was stone-built and often decorated at the sides. As for human sacrifice, some scholars have argued that it was practised by the Minoan civilization, citing examples from myths such as that of Iphigeneia; but this is a theory that requires more research before it can be accepted.

Sacrifice was conducted to honour not only the gods but also heroes and heroines in corresponding cults. Very often the word *enagizein* (“make sacrifice to the dead”) is used for heroic cults in contrast with *thuein* (“make offering to the gods”). Many heroes featured in the deme calendars that regulated the sacrifices that were to take place during the year. Most often the sacrifice was followed by a banquet, as in the cult of gods. In addition to blood sacrifice, libations were performed at the tomb of a hero, as on a funerary occasion, and votive offerings would be dedicated to heroic figures, most often objects (vases, shields, etc.) with artistic depictions inspired from the life of the hero. Some scholars have argued that there was sometimes ritual antagonism in sacrifice between gods, or between heroes and gods, as in the case of Erechtheus and Poseidon in Attica.

Salamis (City)

City in Cyprus

Unlike Paphos, which had a predecessor in the Bronze Age and even earlier at the same location, Salamis is a relatively new foundation, dating to the 11th century BC. Its Late Bronze Age predecessor Enkomi lies c.2 km inland, to the southwest. Around the beginning of the 11th century BC the inner harbour of Enkomi silted up, perhaps as a result of earthquakes, and the town was gradually abandoned; its inhabitants chose a site near the sea, which was provided with a natural harbour, and the town of Salamis developed around this harbour. Judging from the perimeter of the 11th-century BC fortification wall, the early town was small, with its necropolis situated *extra muros* to the west. Of the 11th century BC only one sanctuary has been excavated, as well as a portion of the city wall, but there is ample ceramic evidence that the town originated at that time. This is also supported by the discovery of a tomb of the same period, west of the harbour, with a long narrow *dromos* (entrance passage) and a rectangular chamber, of a type which was introduced to the island from the Aegean. According to mythical tradition the founder of Salamis was Teucer, the son of Telamon, king

of the island of Salamis (near Attica) and brother of Ajax, who came to the island after the end of the Trojan War. Underlying this myth may be the phenomenon of the foundation of new towns by Achaean immigrants of the 12th century BC, after they finally established themselves on the island and gained political power.

Salamis of the Dark Ages (10th and 9th centuries BC) is not represented in the archaeological record, but the 8th–7th centuries BC are represented by a number of large built tombs with monumental *dromoi*. Although the chambers of these tombs have been found looted or half-looted, many important objects were found in the spacious *dromoi* which the looters left intact. The size of the tombs, their style, and the wealth of objects which they have yielded justify their identification as “royal”, although not all of them were used for the burial of members of the royal family. As in other tombs, at Salamis too there must have been an aristocratic elite, probably the descendants of the Achaean immigrants of the 12th–11th centuries BC. The burial customs which have been observed for these “royal” burials are remarkable: the dead person was placed in a ceremonial chariot or hearse, drawn by two or four horses, and was carried to the tomb. The chariots and horses were richly adorned with bronze plaques and gear respectively, all decorated in repoussé with Egyptianizing scenes. The chariot was drawn down the slope of the *dromos* to near the entrance of the chamber. There the horses were ceremonially killed. The sacrificing of horses in honour of the dead recalls Mycenaean burial customs. In one case there is evidence for the burial of slaves in the *dromos* of a tomb to serve their master in the afterlife. Among the tomb gifts there were weapons and ivory furniture (a bed and a throne were found in Tomb 79). There were also iron skewers (*obeloi*) and firedogs of a type known on Crete and in the Argolid during the same period. The burial customs of the “royal” tombs of Salamis, as well as the gifts offered to the dead, recall customs and objects mentioned by Homer in the *Iliad* (book 23, where the burial of Patroclus is described). This has led some scholars to interpret the appearance of such burial customs at Salamis as the result of the reciting of the Homeric epic in the court of Salamis. The most plausible explanation, however, is that such “heroic burials” also existed on the Greek mainland, and it was quite natural for the aristocratic elite of Salamis to imitate these burial customs.

Salamis maintained close relations with Greece throughout its history. In a “royal tomb” of the 8th century BC a large number of Greek Geometric bowls and dishes were found, as well as a *krater* (mixing bowl). The dead person, a woman, was cremated and her incinerated remains together with her necklace were put in a bronze cauldron. Gjerstad ingeniously proposed that this was the tomb of a

Greek princess who had married into the royal court of Salamis.

Salamis of the late-Archaic and Classical periods is known from tombs as well as the votive offerings belonging to a sanctuary on the western outskirts of the town. The style of the limestone statues, most of them female, imitates that of the Greek *korai* of the end of the 6th and the beginning of the 5th century BC.

The earliest king of Salamis whose name is known is Euelthon (560–525 BC). He was the first to issue silver coins on the island in 530 BC. Herodotus (4. 162) records that queen Pheretima of Cyrene visited Euelthon in 530 and asked for his assistance in re-establishing her son on the throne. Herodotus also mentions Euelthon as having dedicated an incense burner at Delphi, which could be seen in the treasury of the Corinthians. Another Salaminian who offered a *peplos* (robe) at Delphi, woven by himself, was Helicon, son of Acesas.

Herodotus describes very vividly the dramatic events connected with the Ionian revolt and the active participation of the Salaminians under their king Onesilus (5. 104, 108–16). The latter managed to dethrone his brother, the pro-Persian king, and lead the revolt. He died while besieging the pro-Persian kingdom of Amathus.

One of the most famous kings of Salamis was Evagoras I, probably a member of the Teucrid royal family and a great supporter of Athenian policies. He was honoured by the Athenians, who erected his statue in the Agora of Athens next to the statue of Zeus Eleutherios. His ideal was to unite all the Greeks under the leadership of Athens. In Cyprus his efforts were to unite all Cypriot kingdoms under the leadership of Salamis in order to free the island from the Persians. Neither of these ideals was fulfilled. He fought against the Persians and helped the Athenians against the Lacedaemonians. He died in 374/73 BC, a few years after the Peace of Antalcidas was signed in 386, which decreed that all cities of Asia and Cyprus should belong to the Great King. The Greek orator Isocrates praised Evagoras in one of his orations; Isocrates was the tutor of his son, Nicocles.

A funerary monument, the cenotaph of the last king of Salamis Nicocreon, was excavated in the necropolis of Salamis. On the funerary pyre, under the tumulus of earth, the Salaminians buried rich gifts for the brave king and the members of the royal family who preferred to die rather than surrender to the Ptolemies. This event, narrated by Diodorus, is dated to 311 BC. The burial may have been effected by Demetrius Poliorcetes, who became the ruler of Cyprus in 306 BC.

Salamis continued to be one of the most important cities of Cyprus, but with the transfer of the capital to Paphos in the 1st century BC the city must have lost some of its glamour. Its harbour and its rich hinterland, however, contributed to its continued prosperity. During

the Roman period the city enjoyed the favours of Trajan and Hadrian, who erected public buildings such as the gymnasium and the theatre, which they adorned with marble statues. The temple of Zeus Salaminios was considered to be one of the most important religious centres in the island. Recent excavations have revealed some of the splendours of Salamis in the northern part of the town including a gymnasium, a theatre, an amphitheatre, a *xystos* (colonnade), and spacious baths.

The city was destroyed by the earthquakes of the 4th century AD, after which it was reconstructed on a smaller scale as a Christian city, named Constantia in honour of the emperor Constantius II, who assisted in its reconstruction.

Salamis (Island)

Island in the Saronic gulf

The island of Salamis sits off the western coast of Attica. It is the northernmost island of those which lie in the Saronic Gulf. The island is approximately 100 sq km in area. The terrain is mountainous, with some arable plains. There are no rivers running on the island today. The vegetation consists largely of pine, scrub oak, and olive.

The island was inhabited from at least the Neolithic period. Excavation in a cave on the south coast of the island has produced numerous stone implements. In addition, prehistoric pottery has been found at various spots on the island. The Bronze Age is well represented by tombs and pottery, both of which have been found all over the island. The remains of a Bronze Age settlement may be seen at Ginani in the southern part of the island. A large sub-Mycenaean cemetery was excavated on Salamis around the start of the 20th century. It yielded much pottery, some of which came from Attica. There was thus a connection of some kind between the two places from an early period.

Although the centuries between 1000 and 800 BC are less well represented, there is some evidence of habitation, and from the Archaic period through to the present there is clear, continuous habitation. While the area most heavily inhabited in the Bronze Age seems to have been the southern section of the island, in the Archaic and Classical periods the settlement moved north to the middle of the island. The Classical city sat on a peninsula on the east which juts out towards Attica. Later, at a date which is still not certain, the principal settlement moved to the west coast of the island, and this city (modern Salamina) is still the principal city on Salamis.

The mythology of the island is related by the 1st-century BC historian Diodorus Siculus, among others, who says that Telamon and Peleus killed their brother Phocus on the island of Aegina, and then Peleus fled to Thessaly and Telamon to Salamis. Telamon, according to one version of the story, was then married to the daughter of the king of Salamis, and they had a son, Ajax. When the old king died, Telamon inherited the island, and one of his grandsons in turn gave it to the Athenians. (Peleus married Thetis and she bore him Achilles. Thus Achilles and Ajax are cousins.)

The close ties between Athens and Salamis are further demonstrated by the earliest Athenian decree (late 6th century BC), which deals with regulations for those living on the island, and by the use of Ajax as one of the ten eponymous heroes chosen by Cleisthenes in 508 BC for the Athenian tribes. Ajax was the only non-Athenian in the group.

In 480 a critical naval battle in the Persian Wars was fought in the straits between Salamis and Athens. The smaller, swifter ships of the Athenians outmanoeuvred the large Persian ships, and the Athenians and their allies defeated a larger power. This battle became a legend in Athenian history, and a *topos* in Athenian literature. Thus later writers who refer to Salamis often do so with reference to this battle. The island itself served as a refuge for women and children during the Persian invasion of Athens.

At least two major figures in the 5th century had connections with

Salamis. Towards the end of the Peloponnesian War democratic sympathizers took refuge on the island, and they were pursued there by the Thirty Tyrants. An incident involving one such individual, a certain Leon, is mentioned by Socrates in the *Apology*. Socrates was meant to retrieve Leon from Salamis, but he refused to do so. Also there was a tradition that the playwright Euripides was born on the island, and that he used to write his plays there in a cave overlooking the sea.

Mention must be made of two groups of people who lived on the mainland of Attica and called themselves Salaminioi, i.e. men from Salamis. These men from Salamis were dubbed the Salaminioi of the Heptaphylai, and the Salaminioi from Sunium. It is unclear when, where, and why they had their origins, and furthermore we have little idea of their purpose. They are known through fragmentary inscriptions, and study of those is still ongoing. They were apparently a kinship group with a civic function.

Aristotle tells us that Salamis had its own archon, although no remains of any inscriptions concerning archons on the island have been identified. It is also known (from the *Athenaion Politeia*) that Salamis had its own dramatic festival, but no remains of the ancient theatre have been found.

The island changed hands in the late 4th century, when Demetrius was in control at Athens, but there is little other solid information about the status of the island in the literature of the Hellenistic period. It is known through inscriptional evidence that the Ephebes, Athenian (and later, wealthy Roman) young men in military training, performed some of their activities on and around the island. Numerous honorific inscriptions attest to their good behaviour while on the island.

Roman pottery is visible at many sites on the island and it is thus clear that Salamis remained active in the waning years of the pre-Christian era, and the subsequent centuries of the empire.

Samos

Island in the east Aegean

Samos is one of the larger of the Aegean islands, with an area of 492 sq km, and it lies closest of all of them to the coast of Asia Minor: the channel dividing it from Turkey is today only 3 km wide, and in prehistoric times it was joined to the mainland. In antiquity it was known as both Parthenia and Anthemus, but as Samos from at least the 5th century BC. Pausanias (10. 12) claimed that the island had an early distinction as the home of one of the first of the Sybils. It is quite mountainous, well watered, and heavily wooded, and has always been known principally for the fertility of its land; the island still exports olive oil and tobacco. While for later centuries the fineness of Samian muscat wine was much famed, and was later to be extolled by Byron, it was not always thus. Strabo (*Geography*, 14) emphasized the poor quality of the island's wine compared with other islands in the region, but praised its other products, and quoted Menander as saying that "it even produces birds' milk".

Throughout the pre-Christian period from the 3rd millennium BC the island was populated, but it was only in the 6th century BC that Samos knew real fame and power, when the tyrant Polycrates established himself as sole ruler. He built up a powerful fleet, annexed other islands, and established a famous court that attracted artists of all kinds. A tunnel more than 900 m long that was completed in 524 BC under the direction of Eupalinus of Megara, ensuring a water supply to the city of ancient Samos in time of siege, remains to this day a unique monument to another aspect of his reign. To Polycrates is also attributed the construction of a man-made harbour and breakwater. The success with which the Samians resisted a siege by the Lacedaemonians for 40 days (Herodotus, 3. 56) during the reign of Polycrates, when they were unable to bring about the city's subjection, was no doubt due in part to this tunnel. The tyrant's eventual death at the hands of Oroetes is described by Herodotus (3.

125): “He slew him in a way too horrible to describe, and then crucified him.”

At least one and a half millennia of the history of Samos can be traced in the extensive coastal site of the sanctuary of Hera, known as the Heraion. Its earliest remains date from the Bronze Age, but its most impressive feature, which was known all over the Hellenic world, was the great temple built during the 6th century BC; its size (it was almost 100 m in length) caused Herodotus to state that it was the largest of all the temples he had seen. “Its first architect was Rhoecus, the son of Phileas, who was a Samian” (3. 60). Burnt down in the later 6th century BC, it was rebuilt, with numerous other structures added at various dates, before an early Christian basilica was built at its east end during the 5th century AD; a cistern here was in use into the 6th century AD. Pausanias also credited the same Rhoecus with being one of the first Greeks to make images by casting molten bronze (8. 14). Another 6th-century BC artist of great fame was Theodorus of Samos, who was a sculptor and architect, and made a magnificent ring of gold and emeralds for the tyrant Polycrates. He was credited by Pliny (*Naturalis Historia*, 34. 83) with creating the first self-portrait to be made in bronze.

Samothrace

Island in the northern Aegean

Samothrace lies in the northern Aegean, at a point approximately equidistant from Thasos, Alexandroupolis, and the Gallipoli peninsula. It covers an area of 176 sq km and is well watered and quite fertile, although it has a ruggedly mountainous interior. It was from the “topmost peak of wooded Samothrace” that Poseidon was said by Homer to have watched the fighting on the plains of Troy (*Iliad*, 13. 12). Pausanias (7. 4) records that it was first called Dardania, a name perpetuated in the important sea channel nearby of the Dardanelles.

Samothrace has been populated from earliest times, but controversy surrounds the place of origin of its inhabitants. It was peopled initially by Thracians from the nearest part of the mainland of what is now northern Greece. In the Classical period colonists were said to have come to the island from Samos in the 8th century BC, hence its name. However, archaeological evidence tends to support Lesbos or the Troad as the source of these new settlers, though the Thracian dialect continued to be used until the end of the pre-Christian era.

The outstanding importance and fame of Samothrace in the Hellenic world was due to its being the focus of a cult, which caused the island to become the foremost religious centre in the northern Aegean from the 6th to the 1st century BC. The sanctuary of the Great Gods, excavation of which has continued for over a century, reveals that a complex process of initiation rites took place there. The mysteries that were enacted here are referred to by Plato and Aristophanes, and it is known that the historian Herodotus (among many others) underwent them. The physical remains of the sanctuary are immensely impressive; the rotunda, dedicated to the Great Gods by queen Arsinoe in the late 3rd century BC, is the largest circular structure known to have been built by Greek architects. The world-famous statue of the Winged Victory, also known as the Nike of Samothrace and now in the Louvre, was found here in 1863. With the statue of Venus found on Melos it perhaps shares the distinction of representing the essence of the Hellenic artistic spirit of its age.

Sanctuaries

In the context of Classical Greece a “sanctuary” is best defined as a sacred space, formally bounded and set aside for ritual activity. In historical times at least, such centres usually provided sanctuary in the sense of asylum for refugees from human or divine persecution.

Most of the important sanctuaries of Classical Greece were founded or underwent major development from the 8th century BC. The traditional date of 776 BC for the foundation of the Olympic Games is a good benchmark. The evidence is at first provided chiefly by sacrificial debris and small-scale votive offerings (among which pottery and terracotta and bronze figurines are prominent) at sites such as the sanctuary of Zeus at Olympia. Modest temples were

sometimes built, but the most prominent structural and ritual component of the sanctuary was always the altar where sacrificial victims were burned.

Although ritual activity in sanctuaries was standardized to a degree (public and private sacrifice, votive offerings, some components of festivals), there were numerous local variations corresponding to the character of the individual cults.

Greek sanctuaries developed an increasingly monumental character after 700 BC, with first temples, then other buildings, constructed of ashlar masonry. These tended to accumulate slowly and haphazardly (e.g. at Olympia) in and around the sacred area. Only in the Hellenistic period did formal regular planning become the norm and then it could be effectively applied only to new or previously undeveloped sites (e.g. the Asclepieum on Cos).

The architectural character of sanctuaries, such as that of Apollo at Delphi in the late-Classical and Hellenistic periods, when structural development was most intense, provides the clearest indication of the major aspects of the festivals – athletic competitions (stadia, gymnasia, baths, offerings of victors), theatrical events (theatres, offerings). Their administration and the importance of the major sanctuaries (especially the Panhellenic centres of Olympia, Delphi, Isthmia, and Nemea) as international meeting places are indicated by other elements, such as *bonleuteria* (council chambers) and treasuries, as well as significant sculptural and architectural dedications, which often had a propaganda intent. Some of these functions are likely to go back to the period of expansion of the sanctuaries in the 8th century BC, although (unless the large bronze tripods from Olympia are athletic prizes, as is sometimes thought) there is little direct evidence, since most of them can be carried on without the need for any formal structures (races can be run on open ground: a stadium is a luxury).

In the Roman period the use of the Greek sanctuaries continued uninterrupted, although new buildings (the bath houses are particularly common and striking) were regularly added in the new and distinctive building style of concrete and brick. The appearance of temples to house the imperial cult (there was a temple to Rome and Augustus on the Athenian Acropolis) is another distinctive feature.

As Christianity gradually took hold of the Roman world, especially after its adoption in AD 313 by the emperor Constantine, the pagan sanctuaries went into decline, although they continued to be patronized at least until closed by edict of Justinian in AD 529.

The fact that many ancient sanctuaries have later Christian churches within their boundaries (at Olympia the workshop of Phidias was converted into a church in the 5th century AD), and particularly that some of these (the basilica at the sanctuary of Asclepius, Epidauros,

c.AD 400) seem to have been built before the pagan complex became defunct, shows that sometimes paganism and Christianity intermingled and that the places retained their sacred character, even when the formal nature of the religion changed. Some later monasteries (e.g. at Daphni, on the outskirts of Athens) are even built on the sites of ancient sanctuaries, and the modern buildings incorporate material from the ancient.

While the sanctuary in the sense defined at the beginning of this entry seems essentially a creation of the Geometric period and to have died with the banning of pagan religion, various similarities of form and function can be identified at sites of both earlier and later periods. In Greece some prehistoric sites have been designated sanctuaries, with varying degrees of probability and correspondence to the above definition. Although the Neolithic period is a blank, in the Early Bronze Age the Cycladic island of Keros has sometimes been thought a sanctuary on the grounds of unusually rich discoveries of marble artefacts, but this is disputed. More plausible is the rustic shrine at Korfi t'Aroniou on Naxos, which was uniquely adorned by decorated stone blocks.

In Minoan Crete the most convincing candidates are the peak sanctuaries, remote hilltop sites with clear evidence of exclusively ritual activity (sacrifice, votive offerings). The Middle Minoan complex at Anemopsilia, near Archanes, is perhaps a temple rather than a sanctuary, but its ritual use is undoubted. Sacred groves are sometimes identified in scenes in art (seal stones, the "sacred grove" fresco from Knossos). Some houses (especially Xeste 3) at Akrotiri on the Cycladic island of Thera have extensive and clearly ritual painted scenes but their assignation as sanctuaries is difficult, since the focus again seems to be on the individual building rather than a sanctuary area; the same is true of other ritual structures, such as the "temple" on the island of Kea, the Mycenaean-type "sanctuary" at Phylakopi on Melos, the "cult centre" at Mycenae itself (a stronger candidate), or the shrine area at Mycenaean Tiryns.

It is impossible to say how far the elaborate festivals, often involving athletic and dramatic competitions, so characteristic of Classical sanctuaries, may have existed in prehistoric times, but there is so far no evidence for the sort of installations that later became the norm. One could however appeal to the funeral games mentioned in Homer or the scenes of chariots on Mycenaean gravestones and vases as hints of similar activities in earlier times.

While a few important later sanctuaries (Hera on Samos, Apollo Maleatas at Epidaurus, etc.) have produced virtually certain evidence of continuous use from prehistoric times into Classical antiquity, the extent to which this reflects continuity of religious belief and practice

in detail is obscure. As well as these possible prehistoric predecessors, the continued use of parts of some sanctuary sites after AD 529 has already been mentioned. Several aspects of ancient practice associated with sanctuaries find echoes even up to the present day, although the degree of genuine continuity is hard to assess, partly because people look for similar relationships with their gods, whether Christian or pagan, and may approach them with similar rituals.

Santorini

Island in the Cyclades

This form of the island's name is Frankish, from Santa Irini, one of the local churches. In antiquity, as often nowadays, it was called Thera, also at times Kalliste and Strongyle. At the southeast of the Cycladic group, it is geologically the most remarkable of the Cyclades, since it contains an active volcano.

Although there have been numerous recorded volcanic episodes over the last 4000 years, sometimes severe, the most violent concluded with the explosion and collapse of the crater in a massive catastrophe during the Bronze Age (c.1500 BC, or 1628 BC if recent scientific analyses are correctly interpreted). During the eruption phases at that time the volcano disgorged pumice and tephra (volcanic ash). The latter covered the island with a layer up to 50 m thick. This extraordinary event is thought by some to have been the source of the myth reported by Plato of the submerged city of Atlantis. Research has shown that tephra was also deposited in substantial quantities on Crete, Rhodes, and the mainland of Asia Minor, with potentially serious consequences for the agriculture of those areas. The massive tidal wave which followed the collapse of the crater almost certainly inflicted heavy damage on coastal sites in the southern Aegean. The psychological consequences of this catastrophe cannot now be accurately assessed but were surely profound, and must have played a part in the transfer of political and cultural authority in the Aegean from Minoan Crete to the Mycenaeans of mainland Greece, by weakening the former.

At the time of the eruption the material culture of Thera was spectacular. Archaeological work near Akrotiri since 1967 has uncovered a town with many buildings in fine ashlar masonry and richly decorated with frescos. If the unusually good state of preservation has not led to an overestimation of the significance of Late Bronze Age Thera, it may well have been a centre of architecture and the arts whose influence spread throughout the Aegean. Even if, as seems more probable, the artistic and technical achievements of the Therans were learnt from the Cretan palaces, it was nonetheless probably a centre of Cretan authority in the Aegean and must have acted as a conduit through which ideas and techniques were exchanged.

In later mythology Thera got its name from Theras, who supposedly came there with a group of settlers from Sparta. This would explain the Dorian character of the island. Thera seems to have had significant settlement from the Geometric period and produced locally distinctive Geometric and Orientalizing pottery. The earliest remains of the ancient town, on an impressive but remote site high on Mesa Vouno, belong to the Archaic period. The nearby cemetery (Sellada) has produced finds from the Geometric period onwards, including three archaic *kouroi* (nude statues of standing young men). Therans founded the colony of Cyrene in 631 BC, according to Herodotus because their homeland was devastated by a long drought. The place flourished particularly in Hellenistic times, to which many of its surviving remains belong and when it was a forward naval station under the

Ptolemies. It does not seem to have been particularly important in the Roman or Byzantine periods, although there are remains of both, including the painted church of the Panagia Episkopi, reputedly founded by the emperor Alexios I Komnenos (1081–1118).

Sappho

Poet of the 7th–6th centuries BC

Born probably at Eressos on Lesbos around 630 BC, Sappho was a contemporary of Alcaeus and of Pittacus, the tyrant of Lesbos. Her family may have been involved in the same upheavals among aristocratic factions that feature prominently in Alcaeus, since sometime before 595–594 BC she is said to have been exiled to Syracuse, where there was a statue of her down to the 1st century BC. She seems otherwise to have spent most of her life in Mytilene.

The remains of Sappho's poetry consist of one whole poem (poem 1), preserved by Dionysius of Halicarnassus as an example of the "smooth and exuberant" style, in which she invokes Aphrodite to assist her in love; about ten substantial fragments, including five stanzas (poem 31) preserved by "Longinus", describing the physical symptoms of love; 100 short citations from ancient writers; and around 50 papyrus fragments. The poems are written in the Aeolic dialect native to Lesbos. Unlike that of Alcaeus, Sappho's extant poetry barely mentions contemporary politics, and her focus of interest instead is on individual emotion, and the traditional female concerns of love, marriage, and beauty. This focus accords with the general tendency of the early lyric poets to reject the Homeric role of

poet as impersonal narrator. No more than the other lyricists, however, did Sappho ignore Homer, and some of her poetry seems to recast Homeric themes from a female perspective.

Her poetry indicates intense romantic and probable sexual involvement with some of the young women of whom she writes. The exact nature of these relationships must remain uncertain because our evidence is so fragmentary: possibly as early as Anacreon, but certainly by the time of Ovid's *Heroides*, the affairs were assumed to be sexual. Female same-sex love is rarely mentioned, though not unattested, in early Greece, and may have become taboo later on, but one may assume that such relationships and sentiments were acceptable in the Lesbos of Sappho's time. A relatively large number of her poems concern young girls, marriage, or farewells. It is therefore sometimes suggested that her poetry reflects a social structure in which young girls came to Sappho prior to marriage for some kind of education in music and other arts, and romantic or sexual involvement was part of the educative process. If so, one may compare the better-attested educational relationships between men and boys in the ancient world. Sappho's passionate descriptions of female beauty may be intended to inspire male desire for the girls in marriage – the destination of all Greek girls – as much as it expresses any personal feelings of Sappho herself. Some of the content of Alcman's *Partheneia* may be comparable.

Lesbos was home to an unusually large number of early poets – Terpander and Arion as well as Alcaeus and Sappho. It was also known for the beauty of its women, and as both a gifted poet and a celebrator of female beauty Sappho may be regarded as typical of her island. In later tradition she is regarded as anomalous precisely because of these two features. Although she was not the only female poet in the ancient world, she seems to have outshone others to such a degree that Galen states that “the poet” is Homer, and “the poetess” Sappho. Again, the intense passion of the poems has had a clear effect on her later reputation: one may guess that such passion was unusual, at least from a woman. One late tradition divides Sappho into two people – one a remarkable lyric poet, the other a sex-crazed courtesan. Down to Roman times, emphasis is less on the female objects of her passion than the passion itself, with the result that in Greek comic traditions she is portrayed as heterosexually voracious. Popular tradition recounts that she fell in love with a fisherman called Phaon and threw herself off the Leucadian rock when her passion was unrequited. The story probably derives from mistaken extrapolation from her verse: it appears on vases of the late 5th century BC, and was popular among comic poets from the 4th century BC. Roman attitudes to sexuality focused more on the female objects of her passions, and

the concerns of the late 20th century have made Sappho's perceived lesbian sexuality nearly as important as her poetry.

Ancient sources unanimously praise her brilliance. She is a subject of vase painting from the late 6th century BC. She found favour with Solon and Plato's Socrates, and she is the subject of treatises from at least the 4th century BC. The Alexandrian scholars included her in the canon of the ten lyric poets, arranging her songs in nine books, according to metre. Theocritus, Callimachus, Apollonius, Moschus, and Bion all show her influence. Epigrams honour her: Dioscorides in the late 3rd century BC calls her the tenth Muse, and this honorific title becomes conventional for her thereafter. Her fame in her native island was such that coins from Mytilene of the 1st to 3rd centuries AD bear her portrait.

Sappho's poetic reputation has survived on progressively slimmer evidence, since she suffered the fate of all those writers whose subject matter or dialect did not suit the educational requirements of the later ancient world. Her difficult dialect rendered her writing unsuitable for inclusion in a canon that increasingly favoured Attic Greek: the lyric poets are notoriously under-represented in the body of texts that came to form the educational canon. Moreover, her passionate subject matter, like that of many other lyricists, did not suit the prevailing preference for texts suitable for the classroom.

As the canon came to dominate textual production, fewer and fewer noncanonical texts were copied, especially in the 2nd–4th centuries AD when the transition from the book roll to the codex took place. Even so, some of Sappho's poems did make that transition, and in the 2nd century AD the poems seem to have been popular as after-dinner entertainment. Most surviving papyrus fragments of her poetry may be dated to the 2nd and 3rd centuries AD. Gradually, however, Sappho came to be quoted in short citations more for grammatical or metrical peculiarities than for literary reasons, although writers down to the 6th century AD quote her and show some familiarity with her works. A parchment from Egypt shows that she still had an audience even in the 7th century AD.

After this the trail starts to go cold. This is more likely to be due to a general decline in circulation of all but the most standard authors than to Christian distaste for her subject matter. It is sometimes asserted that her books were burned, for example by Gregory VII in 1073, but the evidence for this is far from conclusive. Although the 9th-century lexicographer Photios cites her, the *Etymologicum Magnum* of c.1000 mentions her only five times and later encyclopaedias after the *Suda* ignore her. Byzantines of the 12th century and later mention her, but it is impossible to determine whether their knowledge derives directly from texts or from reference works. Tzetzes even claims that

her work had disappeared by his time, although this may be an exaggeration. Certainly after the sack of Constantinople in 1453 rare texts such as hers are unlikely to have survived. In 1546 Robert Estienne published the first edition of Dionysius of Halicarnassus, which contains Sappho's only complete surviving poem, and in 1554 there followed the edition of "Longinus".

Satyr Play

The satyr play was a type of Classical Greek drama that stood midway between tragedy and comedy. Satyr plays were composed by tragedians and performed with tragedies at dramatic festivals in

Athens; the rules of these contests required that each tragedian present three tragedies followed by a satyr play. Satyr plays also resembled tragedies in being concerned with mythological subjects for the most part, rather than with contemporary ones, as were comedies. Like comedies, however, satyr plays were humorous, irreverent, and frequently obscene. The chorus was always composed of satyrs, mythological servants of Dionysus who were partly human but had horses' hooves, ears, and tails and wore enormous erect phalluses.

Satyrs were known for their wildness, drunkenness, cowardice, sexual appetite, and total lack of the virtues of civilization. The one satyr play that survives intact, Euripides' *Cyclops*, makes use of these attributes to produce a very funny parody of Homer's tale of Odysseus and the Cyclops, a one-eyed giant named Polyphemus. In Homer's version Odysseus and his men land on the Cyclops' island and are captured after they take some of his food. Polyphemus locks them in his cave and promises to eat a few of them every day for dinner, but Odysseus gets him drunk and blinds him, enabling the men to escape. In Euripides' version Silenus, an old man who cared for Dionysus in his youth, has been shipwrecked on the Cyclops' island with the band of satyrs he leads, and all of them are serving as slaves when Odysseus and his men turn up on the island. Silenus sells them the Cyclops' property in exchange for wine, of which he has long been deprived, but when Polyphemus returns unexpectedly Silenus is terrified and pretends that the Greeks have robbed him by force. The Cyclops imprisons Odysseus' men and eats two of them, but Odysseus plies him with wine, while Silenus does all he can to get some of the wine for himself. Eventually Polyphemus becomes drunk enough to think that he is Zeus and Silenus Ganymede, and carries the frantic Silenus off into the cave. While he is gone Odysseus prepares a burning stake for blinding the giant, but the satyrs, who have promised to help him, prove to be too cowardly to do so. Odysseus gets his crew to help instead, and they blind the Cyclops and escape, taking the chorus with them.

The origins of the satyr play and those of tragedy are probably linked. Aristotle says both that tragedy grew out of the dithyramb and that it emerged from satyric drama; this satyric drama is probably not the Classical satyr play but its ancestor. The link between dithyramb and satyr play may have been made (sometime around 600 BC) by the poet Arion, who is said to have been the first to have his dithyrambs sung by choruses of satyrs. The word "tragedy" itself, which means "goat song", may come from the satyrs of such choruses; although depictions of satyrs on Greek pottery suggest that at an early period their non-human features were those of horses rather than goats, the satyrs in drama may well have disguised themselves as goats or acted

like goats.

One ancient explanation for the development of satyr plays into their Classical form is that as tragedy developed from the dithyramb (originally a hymn to Dionysus), the tragedians started to use plots that had nothing to do with Dionysus; this annoyed the audience, and to satisfy them the poets invented the satyr play. More modern ideas are that the satyr play started from a humorous part of a tragedy (functioning to relieve tension like the grave-diggers in *Hamlet*) that was gradually split off, or that satyr plays were a genre parallel to tragedy that evolved somewhere in the Peloponnese while tragedy was emerging at Athens. In any case, the structure of satyr plays seems to be much like that of tragedies, though the length of the *Cyclops* suggests that such plays were in general much shorter than tragedies. They were probably performed, like tragedies, by three actors and a chorus of 12 (later 15).

According to legend, the first writer of satyr plays in their classical form was Pratinas of Phlius at the beginning of the 5th century BC; he was one of the most important and prolific writers of such works, but almost none of his output survives. Pratinas' son Aristias was another great writer of satyr plays, as was the tragedian Aeschylus, parts of whose satyr play *Dictyulci* have survived on papyrus. Euripides had a tendency to replace satyr plays with tragedies that had happy endings, such as the *Alcestis*, or with humorous pieces that did not use a chorus of satyrs; it is possible that Sophocles too may have written such "prosatyric" plays. Both dramatists, however, also wrote a number of satyr plays; Euripides' *Cyclops* survives intact, and a large portion of Sophocles' *Ichneutae* has been found on papyrus.

In the 4th century BC the production of satyr plays declined, and their number was reduced to one per tragic festival, rather than one per trilogy. The genre was revived in the Alexandrian period and still kept its chorus of satyrs, although these late satyr plays seem to have been concerned with contemporary events as well as with mythology. Eventually the genre inspired a type of Latin satyr play in Rome but died out in Greece. The satyr play has remained essentially a dead form to the present day, though the *Cyclops* and the *Ichneutae* are occasionally performed, the latter sometimes with a good deal of modern creativity supplying the missing portions.

Scepticism

The philosophical denial of the possibility of human knowledge

There are varieties of scepticism. Natural scepticism is simply asking for sufficient evidence before trusting some claim. This mode of doubting protects people from ignorance or credulity. Philosophical scepticism goes far beyond this.

Scepticism comes from *skeptomai*, which means “I inquire, consider, reflect”. Inquiry can lead to answers (*dogma*), or to confusion when there is no reliable way to decide between competing answers.

Philosophical scepticism challenges all claims to knowledge by seeking to show that all is confusion. Philosophical scepticism challenges all epistemologies. Doubting, or withholding belief, until satisfactory reasons to believe are offered is the core of the sceptical method.

The Greek sceptics claimed they were the intellectual descendants of Socrates. They believed that the Socratic claim to ignorance, “I only know that I do not know”, was not due to inadequate inquiry. Socrates could not know because no inquiry will ever find any answers.

Actually the real fountainhead of scepticism lay not in Socrates, but in his opponents, the Sophists. These teachers had expressed the confusion felt by many Greeks at the contradictory answers of the Presocratic metaphysicians, and the scepticism implicit in their thought. In addition, the flood of conflicting ideas challenging traditional belief after Alexander the Great’s conquests and the loss of meaning in public life with the end of independence of the city state made despair common.

The sceptics attacked the claims to knowledge made by the dogmatic philosophers, especially the Stoics and Epicureans, by raising the problem of the criterion (Sextus Empiricus, *Outlines*, 1. 21). To answer questions about how a person has acquired knowledge of something, rules of evidence need to be offered. Reasons need to be given. The reasons which support a truth claim (or a value judgement) need in turn to be supported. This eventually leads to an infinite regress, or to circular argument, and not knowledge, they claimed.

Ethically the sceptics rejected positive knowledge of ethical values. For practical reasons they usually adopted a strategy of behaviour that accommodated them to the values prevailing in the community.

Philosophical scepticism began in the Hellenistic age with the teaching of Pyrrho of Elis (c.363–273 BC). His goal was peace through an apathetic state of mind (*ataraxia*). Freedom from care through an

indifferent attitude was the goal of the sceptics in general (Sextus Empiricus, *Outlines*, 1. 8–12).

Pyrrho's ideas were popularized in Athens by his student, Timon of Phlius (320–230 BC). He used lampoons (*silloi*) to attack dogmatic claims. This form of scepticism claimed to be unable to decide if the dogmas of the Stoics and Epicureans could be proved. Since he was unable to decide if something was fact or error, the wise man should suspend judgement until proof could be offered.

In the 3rd century BC a more radical form of scepticism appeared. The Middle or New Academy of Plato became the centre of Academic scepticism. The first of the Academic sceptics was Arcesilaus of Pitane (c.316–240 BC). His arguments attacked the Stoic criterion of knowledge.

The most important of the Academic sceptics was Carneades of Cyrene (c.215–129 BC), who also headed the Academy in Athens. He taught that nothing can be known with certainty, but that there are degrees of probability which will assist the wise when deciding how to act. He was succeeded by Clitomachus (Hasdrubal) of Carthage (c.270–200 BC). Clitomachus was a dedicated popularizer of the arguments of Carneades. Little remains of his 400 works.

The later sceptics revived Pyrrhonism at Alexandria. They include Aenesidemus of Cnossus (c.80 BC–AD 30), Agrippa (dates are unknown), and Sextus Empiricus (c.AD 163–210). The last of these preserved the sceptic tradition. In his works Sextus discusses the methods of his predecessors including the use of modes (tropes) of doubting used to attack empirical claims. Essentially these pile enough differences in sense impressions to create doubt, so suspension of judgement is warranted. He also presents arguments for attacking rationalist claims to knowledge.

Eventually Greek teachers and Roman students of the Academy, such as Cicero, were to spread scepticism to Roman literature where it would be refuted by Plotinus and Augustine. The success of these critiques of scepticism was to last for over a thousand years.

Scholarship, History of

Whether there is any Greek word that corresponds to the English “scholarship” may be doubted. Nevertheless it is clear from what is known of men of letters in antiquity that they engaged in activities that would fall within any ordinary definition of the term. The understanding and criticism of literature were stimulated by the existence of schools where Homer and other poets formed a substantial part of the syllabus, and the teacher was forced to explain the texts and answer questions. Apart from the numerous minor linguistic difficulties arising from archaic words in Homer there were bigger questions: how could one interpret suitably such passages as Hera’s approaches to Zeus in *Iliad* 14 or the tale of Hephaestus catching Ares and Aphrodite in flagrante delicto in *Odyssey* 8? For that difficulty it seems probable that the method of allegorical interpretation was invented, apparently by Theagenes of Rhegion (c.525 BC).

A desire to illuminate literary history and the origins of genres becomes visible in Aristotle’s circle in such works as his *Homeric Questions* or the lists of dramatists who had won victories in the competitions at the Athenian state festivals, and a teleological view of the world was naturally conducive to such inquiries. But most of what

would nowadays be considered literary scholarship (I leave out of account philosophical monographs and commentaries on Plato and Aristotle) appears to be the invention of men working in Alexandria in the 3rd and 2nd centuries BC. The librarians at the Museum collected Greek literature systematically, and they must soon have been puzzled and dismayed by the number of texts that had unintelligible passages resulting from careless transcription, or – worse still – by serious discrepancies between copies of the same text, a problem very noticeable in the case of Homer. There were also questions of authenticity. Though our sources of information on all these matters are very fragmentary, it is clear that discussions in the Museum led to the development of a number of aids for the reader, some of them mundane, such as the possibility of marking the accents so as to facilitate reading or the insistence on dividing lines of lyric verse so as to respect the metrical units, and others more sophisticated, such as the use of symbols in the left-hand margin of texts to advise the reader of certain problems raised by the passages in question. And with all this there had to be a second-order literature, i.e. books about books. Some of these were detailed commentaries on the texts, in others the critic expounded a topic and offered solutions to the problems, sometimes with an explicit mention of the principles by which puzzles might be solved. An enormous quantity of such literature was produced in antiquity. The most important scholars and critics were Zenodotus, Callimachus, Aristophanes of Byzantium, and Aristarchus. None of their work survives in its original form; at best we have brief citations, more usually a substantially rephrased and abbreviated version of their views, often not specifically attributed to the original author. So it is not always clear to whom we owe the best ideas; it is for instance a matter of debate whether Aristarchus is to be credited with the important maxim that “Homer should be illuminated from Homer”, in other words that one needs to explain difficulties as far as possible by looking elsewhere in the writings of the same author. The question then arose whether a unique feature could be accepted, and one anonymous scholar formulated the necessary principle that in Homer there are many unique words, without which there would have been a temptation to deal drastically with the text. As it was, some critics declared a number of passages “improper” for one reason or another, but fortunately they did not go so far as to delete the lines in question, which would have had disastrous consequences, since their judgement now seems to us to have been at fault in most cases. Nevertheless there are many stimulating observations to be found in the surviving sources, for example the note that remarks that in the first book of the *Iliad* there are no similes, or the statement attributed to both Aristophanes of Byzantium and Aristarchus that the end of the

Odyssey is to be placed at line 296 of book 23. It is therefore extremely unfortunate that the only critical monographs to survive from antiquity in their original form are not by the leading scholars of the period c.275–150 BC but works of later date or of marginal interest. The earliest appears to be a discussion of Aratus' and Eudoxus' *Phaenomena* by the astronomer and geographer Hipparchus (c.150 BC); the most famous, assuming it to be genuine, the brief *Techne Grammatike* of Dionysius Thrax (fl. c.150–90 BC); others are an essay by one Heraclitus (1st century AD?) on allegory in Homer and part of a commentary by Didymus (1st century BC) on speeches 9–11 and 13 of Demosthenes; this is a careless and unimpressive piece of work by a man whose fluent pen made him almost proverbial.

Any author of reasonably high quality could become the subject of a commentary, especially if his works were adopted for the school curriculum. But the lion's share of attention went to Homer, a fact reflected in the bulk of the surviving scholia, that is, notes written in the margins of medieval manuscripts but deriving from ancient monographs. One especially famous manuscript of the *Iliad* (Venice, Biblioteca Nazionale Marciana, gr. 454) has preserved a quantity of material not known from any other source, with many snippets of information or judgements attributed to their authors. This manuscript gives us an idea of the specialized and detailed nature of studies devoted to Homer, including a great deal of a book by a certain Nicanor (fl. c.AD 130), on the correct way to punctuate the more complex sentences in Homer; what was presumably a series of notes presented as a running commentary has been divided into tiny sections and inserted into the rest of the commentary at the appropriate places. A similar fate befell an equally specialized monograph on the lyric metres in Aristophanes' comedies: quite a few excerpts of work by Heliodorus (1st century AD) are embedded in the scholia to Aristophanes.

In the expanding and changing cultural world of the late Hellenistic period and the Roman empire, the types of scholarship developed in Alexandria continued to flourish and prove their value. In the Greek-speaking Jewish community of Alexandria the Old Testament was studied in the Greek Septuagint version. Difficulties in the text had already been expounded by one Aristobulus (c.150 BC), and he may have had some connection with the Museum, since he shows occasional awareness of Greek poetry. When the Christians began to study their sacred texts they too availed themselves of the tools of pagan culture. The most notable figure is Origen, active in Alexandria from 202 until 223, then in Caesarea until 253. He and some of his successors were keen exponents of allegory as a means of interpreting the scriptures, but he was also aware of other scholarly methods, and

in his remarkable *Hexapla* he produced an edition of the Old Testament set out in six columns, a somewhat clumsy forerunner of the critical apparatus typical of modern scholarly editions. Origen was not unwilling to use the techniques of the pagan scholars of Alexandria in dealing with the Bible; the same is true to a greater extent of the members of what is generally treated as a rival school in Antioch, whose leading exponents Diodore of Tarsus (d. 394) and Theodore of Mopsuestia (350–428), though ignorant of Hebrew, showed an acute awareness of the problems of translation.

Just as there had been commentaries on Homer and other pagan classics, so too there were commentaries on books of the Bible, and by the early 6th century the number of such texts, though probably not equal in bulk to what had been written about the leading pagan classics, was substantial. But it was difficult, especially in an age of declining economic resources, for readers to find copies of all the commentaries they might wish to consult, and frequently there was repetition of material. A solution was found by selecting and amalgamating notes from existing commentaries or monographs; the new collections of material, generally known as *scholia* on pagan texts and *catenae* on books of the Bible, could be fitted into the margins of the codex form of book that had replaced the roll and become standard since c.AD 400. It is not known exactly when and where this important and time-consuming operation took place, but *catenae* are perhaps the invention of Procopius of Gaza (c.475–538), a leading member of an intellectual circle in which devout Christians continued the study of the pagan classics as part of the educational curriculum. *Catenae* and *scholia*, though very similar, exhibit one important difference: whereas material on pagan texts rarely gives the name of the scholar who is being quoted, many *catenae* make a point of naming the authors of each extract, and it is interesting to note that *catenae* preserve a fair number of observations by Church Fathers such as Origen and Theodore of Mopuestia who subsequently fell out of favour.

Since the 2nd century AD Greek literature had been dominated by the archaizing Atticist movement, which obliged authors to imitate as best they could the language of acknowledged masterpieces written when Athens was at its peak. Manuals of correct usage were produced in abundance; we still have those compiled by Moeris, Phrynichus, and Pollux. The fashion lasted much longer than might have been expected. Classical texts were studied as much for their stylistic qualities as their power to instruct or edify, and their place in the school syllabus was barely affected by the spread of Christianity. Authors were equipped with *scholia* so that teachers should never be at a loss when questioned by pupils, and what had been done for

pagan authors was replicated for the one significant addition to the corpus of *Kunstprosa*, a selection of 16 orations by St Gregory of Nazianzus. No other substantial alterations seem to have been made to the curriculum and essentially the educational system remained unchanged until the end of the Byzantine empire.

Schools and Universities

The word “school” is of Greek origin: *scholē* means “leisure, liberty from waged work and affairs of state”. This leisure time could be devoted to scholarly studies. In this way the place where such occupations were practised received the same name. Through Latin (*schola*) the term then passed into many European languages. The “university” (from Latin *universitas*, “totality, teaching staff”), however, is a product of medieval western Europe; it did not exist in an institutionalized form in the Byzantine empire. Nevertheless facilities for a higher scholarly education already existed in Classical times (and later in the Byzantine period), but one should rather speak of academics or colleges.

An essential aspect of schools and academies in antiquity and in Byzantium is that they were mostly organized on a private basis. The state was not responsible for education and therefore there was no compulsory schooling or any continuous support for academics – it

happened only occasionally that some project received support – or any permanently employed teachers. On the other hand, society as well as state authorities had an interest in passing on the cultural values of their civilization to the younger generation to make good citizens of them. In addition, the state was intent on getting good staff for its civil service and thus had a natural interest in enabling children and young people to obtain a comprehensive general education.

Fixed educational forms existed from approximately the 6th century BC. One of the few organized schools of this period was to be found in Sparta. Boys there were educated under state control between the ages of 7 and 29. In addition to elementary teaching in the basic principles of reading and writing, music and sports were taught. To a large extent the education was oriented towards the military in order to prepare boys for a life as soldiers. Girls received a similarly regulated education meant to prepare them for their social roles as mothers and educators of their children.

These elementary schools, which were mostly private, were also found in other regions of Greece. In Athens this educational form must have existed from at least the 6th century BC, as widespread writing skills demonstrate (e.g. written votes for citizens). Normally, elementary schools were run by a single teacher (the so-called *grammatistes*, from Greek *gramma*, “letter”) who taught children between the ages of 7 and 14 in his private room. The furnishing was scanty: an easy chair for the teacher, simple benches or stools for the pupils, no tables. Wax tablets and slate pencils or papyrus and ink served as writing materials. The lessons at the *grammatistes* consisted of writing, reading, and arithmetic. Children learned to write by a strictly systematic, bottom-up method: first single letters, then syllables, and finally whole words. Reading was practised in the same way. Memorizing and reciting texts went together with reading them. The pedagogical method was limited to passive instruction, and corporal punishment often used. Since the elementary school-teacher had to support himself from grants by his pupils’ parents, his social standing was not very high. Nor was there any special training for teachers; anybody who could write and read was allowed to act as a teacher. There were no fixed holidays, but no lessons took place on the numerous monthly feasts and holidays.

In the 5th century BC it was the sophists (primarily philosophers and scholars who truly distinguished themselves as educationists) who, more than any others, helped to raise education to a higher level. They gathered young people around them to offer them a more ambitious intellectual training that lasted several years. This was, however, a collective instruction rather than an institutionalized schooling. The sophists were “travelling teachers” who went to

different regions and villages demonstrating their knowledge in order to gain new trainees.

From about the 4th century BC true schools were created instead of individual educational schemes. They provided a secondary education that lasted two years. Boys especially, after finishing elementary school, i.e. at about the age of 14, were instructed – sports and military training apart – in theoretical subjects to achieve the so-called *enkyklios paideia* (“all-round, general education”). Besides scientific subjects (viz. geometry, arithmetic, music, astronomy) literary studies were mostly pursued. The Classical Greek writers – mainly poets, but also historians – were read, and their works were analysed and explained from a lexical and a grammatical perspective as well as in relation to their contents. The theory of grammar, which was an independent discipline, was treated too. Moreover, pupils had to do practical exercises in the form of literary essays.

These educational institutions, the so-called ephebic colleges (from Greek *ephebos*, “boy who has reached puberty”), were dependent on the particular town or municipality, which undertook to pay the teachers (Greek *grammatikos*, “grammar teacher”), though often private donors had to help out. Originally, these schools were compulsory for young men but over the centuries they gradually became elite schools for rich parents’ children in the same measure as instruction in the humanities became more significant. The teaching place was the so-called *gymnasion* (the German term *Gymnasium* corresponds to the English “college”) which originally meant sports field. There were comparable higher schools for girls, but here instruction was limited to music and literature.

In the Classical and Hellenistic periods it is impossible to draw a clear line between secondary and higher education. But scholarly instruction concentrated on such subjects as rhetoric and philosophy, which were seen as the main pillars of education. Specialized teachers, i.e. rhetoricians or sophists, gathered groups of pupils around them and trained them – over a period of up to five years – in theoretical and practical rhetoric in a private and friendly atmosphere. From the 2nd century BC Rhodes was particularly famous for its rhetorical schools. There were schools for philosophy as well, as in Athens, where teachers conveyed their philosophical opinions in lectures and personal conversations with the pupils, together with explanations of Classical authors. The two kinds of higher education competed with each other, but also mutually influenced each other. Teachers in these institutions had a high social standing, often occupying honorary state positions. It is striking that no professional training conveying practical skills (except for medicine) was offered in the higher schools. Special skills could only be acquired by practising with a specialized

instructor.

In late antiquity the state, represented by the emperor, increasingly intervened in educational policy in order to induce the towns and municipalities to open new schools and to ensure the teachers' payment. There were practical reasons for this, since the state needed trained civil servants for administrative tasks. Christianization did not have any far-reaching influence on school education since religious education was regarded as the responsibility of the parental home. Schools continued to pass on Classical "pagan" values. As to higher education, centres for special subjects arose in different towns of the empire: Antioch for rhetoric, Athens and Alexandria for philosophy; Berytus (Beirut) for the new subject jurisprudence (under the influence of Roman legislation).

Scopas fl.360–335 BC

Sculptor

Though Scopas is counted as one of the greatest of Classical Greek sculptors, our definite knowledge of him, as with all named ancient sculptors, is slight and partially suspect. What we can reasonably guess from suggestive but unreliable traditions and remains widens our discernment but is also more hazardous. The remaining sculpture and testimonia, however, are so important for our understanding of ancient Greek art and so beautiful that we must make the effort: unreliability is not negation. And the ancient Greeks were excellent judges of their art, so that the traditions, even if unverifiable, can lead our eyes and minds to a just appreciation. Because Scopas was traditionally one of the three great sculptors of the late Classical age – the decades before Alexander's conquests – there are old traditions,

modern attributions, and influences. Out of them an artistic personality emerges.

After the triumphs of the 5th century BC, 4th-century BC artists, while maintaining the basic Classical stylistic criteria of idealism combined with realism, felt the need to change and experiment. Where Praxiteles of Athens (Scopas' main rival) was sensuous and soft in his development of the female nude, and Lysippus of Sicyon interested in reforming the proportions of the male nude (providing, for example, a longer body and a smaller head) in portraits and increasing movement, Scopas of Paros was famed for emotional intensity, for a tragic, which means noble, sense of man's intense struggle. These three sculptors dominated the 4th century BC in the way that Myron, Phidias, and Polyclitus had dominated the 5th century BC, and determined much ancient art for hundreds of years – to Hadrian and beyond. Like their contemporary Plato, they looked to the towering past for their ideals and to the uncertain future in their ideas.

According to Pliny, Scopas was the son of the Parian sculptor Aristandros (working in 405 BC); Scopas is documented as active between 360 and 335 BC. Probably because it is the source of the world's most translucent marble for sculpture, Paros had a long sculptural tradition, including Aristion in the Archaic age and Phidias' pupil Agoracritus in the high Classical age. Scopas, who worked mostly in marble, was to be the greatest in this unbroken line.

We know that Scopas was as esteemed in his own age as in succeeding ages, because he was employed to work on the great projects of the period, including the temple of Athena Alea at Tegea, the Mausoleum of Halicarnassus, and the temple of Artemis at Ephesus. It is from the first of these that we get the best idea of his style.

At Tegea in the Peloponnese Scopas was an architect as well as a sculptor. The original temple had burned down in 395 BC and Scopas was at work some decades later. (The nearby temple of Nemea is so close in style and date that it seems that Scopas was active in the neighbourhood.) Pausanias says of Tegea: "The present temple is far superior to all other temples in the Peloponnese on many grounds, but particularly as regards its embellishment and size" (8. 45). The temple is the best example of 4th-century BC Doric; it was peripteral with a pronaos and opisthodomos and very narrow. Though it was Doric, Scopas brought from his home island a new spirit of lightness and delicacy: the columns were slender, and the interior columns were very early Corinthian with Ionic elements. On one of the pediments Scopas sculpted the *Hunt of the Calydonian Boar* (whose hide the temple displayed), and on the other the *Battle of Telephus and Achilles in the Kaikos Plain*. Many fragments of these sculptures survive and can

be admired in the local museum and in the National Archaeological Museum in Athens. For the temple, Scopas also sculpted an *Asclepius* and a *Hygeia*, whose head, with its expression of divine sweetness, survives (National Archaeological Museum). He also made another *Asclepius* for a temple of Gortys in Arcadia. The squarish warriors' heads from the pediment, though battered, show brooding, deep-set eyes and furrowed brows – the new emotionalism of the 4th century BC.

The Mausoleum of Halicarnassus was the most ambitious monument of its day (355–330 BC), and all good sculptors were eager for employment there. According to Pliny (36. 30) Scopas worked on the frieze of the east side. The panel most usually attributed to him, now in the British Museum, depicts an animated *Battle of Greeks and Amazons*.

Pliny also says (34. 95) that Scopas carved and decorated one of the columns from the famed temple of Artemis at Ephesus, but the remains are too scanty to form a judgement. Of the other statues or copies of statues attributed to him, the finest are probably the deep-eyed *Meleager* (perhaps original) in the gardens of the Villa Medici and the copy of the *Pothos* ("Longing") in the Museo dei Conservatori, both in Rome. For his *Pothos*, Scopas sculpted a youth with crossed legs; his head looks longingly up with melting gaze. The Romans, who starting with Augustus carted off many of his sculptures to their capital, often copied this work, indicating its popularity. The lovely *Dancing Maenad* (a copy) in Dresden is thought to be an example of Scopas' new swirling movement. Callistratus wrote at length about it:

Scopas, as if moved by some inspiration, imparted to the making of his statue the divine frenzy that possessed him ... The Maenad wrought from Parian marble has been transformed into a real Maenad ... You would have seen that, hard as it was, it became soft to resemble the feminine, though its vigour corrected the femininity, and that, though it lacked the power to move, it knew how to dance in Bacchic frenzy, responding to the god as he entered within ... (*Descriptions*, 2. 1–4)

Hellenistic critics considered that Scopas' forte was statues of the gods, a genre unfortunately very poorly represented among the surviving monuments. We know of a *Heracles* for Sicyon, an *Apollo* for Rhamnous, a bronze *Aphrodite Pandemos Riding a Goat* for Elis, an *Artemis Eukleia* for Thebes, a *Dionysus* for Cnidus, a *Hecate* for Argos, and many more: it seems that Scopas was in demand everywhere.

Given his popularity, originality, and skill, it is not surprising that his influence on the ensuing Hellenistic age was pervasive. It has been especially remarked on in the great *Gigantomachy* frieze from the altar

at Pergamum (c.180 BC), now in Berlin. Although it can be frustrating trying to recreate the work and thought of a great artist from toppled stones, hopeful assumptions, and guesswork, Scopas will no doubt continue to provoke lovers of ancient art to do so, in the hopes that he may become for us ever clearer and closer.

Biography

Born in Paros, Scopas was active as a sculptor and architect c.360–335 BC. With Praxiteles and Lysippos he dominated Hellenic art of the 4th century BC. He is known to have worked on the temple of Athena Alea at Tegea, the Mausoleum of Halicarnassus, and the temple of Artemis at Ephesus. In antiquity he was famous for statues of gods.

Sculpture

The mythical Daedalus was viewed in the ancient world as being one of the earliest sculptors in the Greek world. Although he had associations with Crete, he was later thought to have been an Athenian and a member of the Erechtheid family. His name has been linked to “daedalic” statues, which were recognized by Pausanias in the 2nd century AD. These included a statue of *Aphrodite* on the island of Delos which Pausanias (9. 40. 3) believed had been given to

Arriadne by Daedalus.

Daedalus' influence was seen by ancient art historians as giving birth to the Sicyonian school of sculpture in the Peloponnese, which in the fullness of time was to see the appearance of the master sculptor Lysippus. Pliny the Elder (*Naturalis Historia*, 36. 9) retains the tradition that the marble sculptors Dipoenus and Scyllis – thought by Pausanias (2. 15. 1) to be either the pupils or even the sons of Daedalus – settled in Sicyon and made the city a centre of the arts.

Some have seen the creation of monumental sculpture in the Greek world as deriving from contact with Egypt. This tradition, cited by the historian Diodorus Siculus (1. 97. 5–6) in the 1st century BC, links the composition – the Greek term is *rhythmos* – of Daedalus' work with that found in Egypt. Certainly the establishment of a Greek settlement at Naucratis, according to Herodotus during the reign of the pharaoh Amasis, may have facilitated such contact. Whether or not Greek sculpture was derived from Egyptian proportions, it has long been recognized that *kouroi* – naked male statues of the Archaic period – had been carefully designed with set proportions. Such statues were used both as dedications within a sanctuary as well as for placing on tombs. An example of a funerary *kouros* comes from Anavyssos in Attica, where it was erected over the grave of one Croesus who had been killed in battle. *Kouroi* were a regular dedication in the Archaic Ptoan sanctuary in Boeotia.

The Peloponnese, and especially Argos and Sicyon, seems to have been innovative in sculpture, particularly monumental bronzes. Some of the key personalities, fulfilling commissions from both the western and the eastern Greeks, were the sculptors Ageladas of Argos and Canachus of Sicyon. The former is known to have accepted both private and public commissions from the Greek colony of Taras in southern Italy for statues which were erected at Olympia and Delphi, and the latter made a bronze statue for the important sanctuary of Apollo at Didyma in western Asia Minor. Argive sculptors were responsible for a pair of archaic *kouroi* which were dedicated to the Anakes (the Argive version of the Dioscuri) at Delphi; the pair were formerly known as Cleobis and Biton after the sons of the Argive priestess of Hera who according to Herodotus (1. 31) were commemorated by statues at Delphi.

Other schools of sculpture in the Archaic period were located on the islands of Aegina and Naxos. Aeginetan sculptors seem to have been in demand for making victory monuments at Olympia. Marble versions of their work can be glimpsed in the marble pediments, showing the two separate expeditions to Troy, from the temple of Aphaea on the island. The Naxians seem to have had one of the earliest schools of sculpture. Their sculptors made such works as the colossal Naxian

kouros dedicated at Delos, as well as the statue of the Naxian Nicander who dedicated a *kore* (statue of a young woman) to “the far-shooter of arrows” in the sanctuary of Artemis on Delos. The Naxians also seem to be responsible for a large marble sphinx dedicated at Delphi, where it rested on a 10-m-high Ionic column.

Due to the habit of signing works, a more detailed picture can be derived from Attica in the 6th century BC. It is clear that both Attic and non-Attic sculptors (such as Aristion of Paros) were active in creating funerary monuments (*kouroi* and *stelae*) as well as dedications in sanctuaries such as the Athenian Acropolis; for example some 17 sculptors – identified by name, and not all of them from Attica – are known to have worked on the Acropolis alone in the late Archaic period. It seems that around the end of the 6th century BC there may have been a move towards specialization either in funerary sculpture or in religious dedications.

The Archaic period also saw the increased appearance of architectural sculpture. One of the earliest uses was on the temple of Artemis at Corfu where the sculptor has conceived of the triangular pediment as a frame for a series of scenes of differing scales, dominated by a large central gorgon. The temple of Apollo at Delphi received new pediments thanks to the generosity of the exiled Alcmaeonid family in the late 6th century BC (Herodotus, 5. 62). The pediments featured rather static individuals, the *korai* differing little from the freestanding figures found dedicated in Greek sanctuaries or as funerary monuments. The late Archaic period also saw the appearance of highly decorated treasuries at the Panhellenic sanctuaries. One of the best known was the treasury of the Siphnians at Delphi, which was noted by both Herodotus (3. 57) and Pausanias (10. 11. 2). The building identified as the Siphnian treasury was decorated with monumental caryatids, a continuous frieze, and pedimental sculpture. After the Battle of Marathon Athens celebrated its victory over the Persians with a small treasury decorated in the Doric style with metopes of the heroes Theseus and Heracles (Pausanias, 10. 11. 4).

After the Persian Wars there was a move away from the static pose of *kouroi* and *korai*. For example, the replacement group of the tyrannicides (Harmodius and Aristogeiton) made by the sculptors Critios and Nesiotes and erected in the Athenian Agora, showed the pair of “heroes” in the process of striking down the “tyrant” Hipparchus in 514 BC; he was in fact the son of Pisistratus and the younger brother of the actual tyrant Hippias. An attempt was made to distinguish between their ages by showing one of the figures bearded, the other beardless. From the 470s BC comes the hollow-cast statue of a charioteer – part of a larger group – dedicated by the Sicilian tyrant

Polyzalus of Gela to celebrate a chariot victory at the Pythian games at Delphi.

During the 5th century BC, perhaps due to the increasing use of bronze casting, there were numerous innovations in sculpture. One of the key figures who can be identified in this process was Myron of Eleutherae (in Attica). He is perhaps best known for his discus-thrower (or *Discobolus*) where the sculptor has captured a moment in the swing which would never normally be seen by the human eye. The statue itself, though lost, has been recognized in a number of Roman copies. Before this, victors in the discus competition are likely either to have been shown standing holding a discus, or the nature of their victory would have been identified by the inscription accompanying the statue. Such action poses seem to have been the hallmark of Myron. For example, the victory monument for the runner Ladas was celebrated for capturing the runner leaning forward in anticipation of his prize (*Anthologia Graeca*, 16. 54).

A sense of proportion in sculpture was created by Polyclitus of Argos, apparently a pupil of the Argive sculptor Ageladas. He is known to have been interested in the theory of sculpture and was said to have written a treatise on the subject whose tenets were then put into practice by his creation of the canon or spear-carrier (*Doryphoros*). Certainly the distinctive Polyclitan pose – straight and flexed arms, head turned to one side, and straight and flexed legs – suggests the formation of a new style which was to have great influence on subsequent generations of Greek sculptors as well as the creation of an image for the Roman emperor Augustus.

Greek victories against the Persians, notably at Salamis and Plataea but also at the Battle of Eurymedon in the 460s BC, led to the production of a number of monuments to celebrate Greek prowess. This civic patronage may have given opportunity to gifted sculptors such as Phidias who not only became one of the chief overseers for the Pericleian building programme at Athens, but also produced some monumental chryselephantine sculptures. Two of his most famous statues served as cult images for the temples of Athena Parthenos at Athens, and Zeus at Olympia. At Olympia itself the remains of the workshop where Phidias did his work have been found. Neither statue has survived, though both are known from contemporary images, such as the Attic Baksy krater, or from Roman copies. Phidias himself also created a monumental bronze statue of Athena Parthenos, apparently made to celebrate the Athenian victory at Marathon in 490 BC, which was dedicated on the Athenian Acropolis; the tip of the spear could apparently be seen as far away as Cape Sunium.

A number of highly sculpted marble buildings were raised in Athens in the 5th century BC as part of the Pericleian building programme. The

most notable was the Parthenon, which housed Phidias' chryselephantine statue. This highly decorated building, with a continuous frieze, sculpted metopes, and two pediments, must have required teams of sculptors to complete it. Detailed accounts indicate the progression of the temple. At the same time the Acropolis was given a monumental entrance, the Propylaea, and in the 420s BC the bastion above the entrance received a new temple dedicated to Athena Nike and designed by Callicrates. This Ionic building was decorated with a continuous frieze, and the parapet around the temple was decorated with reliefs. This period also saw the erection of the Erechtheum.

Although much attention is focused on Athens of the 5th century BC some major sculptural schemes were being created elsewhere in Greece. At Olympia Phidias' chryselephantine statue of *Zeus* was placed in a Doric temple which was decorated with a sophisticated pair of pedimental sculptures depicting, respectively, the mythical origins of the games and the battle between the Lapiths and the Centaurs. The temple itself must have been nearly complete in 457 BC, as in that year the Spartans and their allies placed a dedication on the roof to celebrate their victory at Tanagra (Pausanias, 5. 10. 4). One of the architects of the Parthenon, Ictinus, was also apparently involved in the creation of the temple of Apollo Epikourios at Bassae near Phigaleia in Arcadia; although some would dispute this connection, the temple carried an internal frieze showing a centauromachy and an amazonomachy.

This tradition of architectural sculpture produced one of the seven wonders of the ancient world, the Mausoleum of Halicarnassus. This monumental tomb was built for Mausolus of Caria, a former Persian satrap. Although this was in western Turkey, technically beyond the Greek world, Mausolus' widow Artemisia engaged notable Greek sculptors to create an elaborate tomb after his death in 353 BC. The tomb was later dismantled, but it is clear that it had a continuous frieze showing an amazonomachy and a chariot race. Individual portrait statues may have stood between columns and the top was decorated with a chariot. Ancient writers such as Pliny the Elder and Vitruvius associate several Greek sculptors with the project: Leochares, Bryaxis, Scopas, Timotheus, and even Praxiteles.

During the 4th century BC a number of personalities in Greek sculpture emerged. In Athens Praxiteles came to prominence and was particularly celebrated for his creation of a naked Aphrodite displayed in a circular temple at Cnidus in western Asia Minor. Scopas, from the island of Paros, was regarded in antiquity as a rival of Praxiteles, no doubt due in part to having his name associated with the Mausoleum of Halicarnassus. One of the most innovative sculptors of the 4th

century BC was Lysippus of Sicyon, who can perhaps be considered the creator of portraiture.

Although the literary sources, especially Pliny, allow us to identify a number of individual artists during the 4th century BC, many extant works are in fact anonymous. These include a group of bronzes from the Piraeus which may have been lost when Sulla destroyed the port in 86 BC. These fine works include an *Athena* and two statues of *Artemis*. Another high-quality bronze of this period is the statue of a youth found in the sea off Marathon.

Attic sculptors continued to make copies of famous Greek works in the Roman period to meet the tastes of the elite in the areas bordering the Mediterranean. A batch of marble reliefs from the Piraeus contains scenes copied from the amazonomachy on the shield of the Athena Parthenos; presumably some educated Roman wished to enhance his villa with elements from this major Athenian monument. An Athenian sculptor, Apollonius son of Archias, signed the bronze herm representing Polyclitus' *Doryphoros* which was found in the Villa of the Papyri at Herculaneum.

Sculpture continued to be created in the Greek east during the period of late antiquity, particularly under the patronage of Constantinople. It includes portraits of local governors, such as those erected at Megara and Athens. Some of the late antique sculpture is in marble, such as the relief of the archangel Gabriel at Antalya in southern Anatolia, derived from the quarries of Proconnesus which had been heavily exploited in the Roman imperial period. Low reliefs continued to be made in the Middle Ages, including representations of the Virgin Orans and Virgin Hodegetria.

Second Sophistic

Literary movement of c.AD 60–410

Philostratus (d. AD 249) coined the term "Second Sophistic" to create a connection between current rhetorical practice and the sophists of the Classical period. He marks the beginning of this "movement" during Nero's reign (c.AD 60), in the speeches (now lost) of Nicetas of Smyrna. This "Second Sophistic" continued until the sack of Rome in AD 410, and included such rhetoricians as Dion of Prusa, Herodes Atticus, his student Aristides (d. c.AD 181), Polemon, and Libanius. Much of the activity of these rhetoricians was in the realm of public performances in aristocrats' mansions, lecture-rooms, libraries, and amphitheatres, mainly in provincial cities such as Smyrna, Ephesus, Antioch, and Pergamum, where their displays were often greeted by large, enthusiastic audiences.

Some idea of the variety of occasions for such performances can be gained from the two treatises on "epideictic" attributed to Menander Rhetor (3rd century AD) and from the *Techne* traditionally attributed to Aristides. These include instructions on how to compose speeches in honour of a city, at birthday and wedding celebrations, or to the emperor or other dignitaries. A very important part of a rhetorician's repertoire consisted of "political" declamations recreating mythological or historical situations, for example, a member of the delegation sent to persuade Achilles to return to the ranks (Aristides, *Orations*, 52). Set-piece descriptions (*ekphraseis*), too, were popular

and influential in other areas of literary production, for example in the works of the “novelists” Longus and Achilles Tatius, who are both described as “Sophists” in the manuscripts. The influence of these rhetoricians extends also to the great Church Fathers, almost all of whom were converts who had studied or taught rhetoric, for example, Gregory of Nazianzus (d. 390) and John Chrysostom (d. 407), who was a student of Libanius.

Many of the rhetoricians in this movement were active in state affairs, as ambassadors, as envoys sent to the emperor to speak in his praise or to secure privileges for their cities. So important was their eloquence that Vespasian established a salaried chair of Greek rhetoric, and Marcus Aurelius sponsored a chair of rhetoric that was worth 10,000 drachmas per year. Many later emperors reserved important offices for distinguished rhetoricians, some of whom moved up in the ranks of the imperial court to achieve even higher honours and more powerful positions.

The display speeches of the new “Sophists” were more than mere entertainment. Aristides, for instance, delivered speeches at festivals in all the great cities of the Greek-speaking parts of the empire, bringing to widely disparate audiences a common set of cultural themes and standards of taste and behaviour, fulfilling, in a way, Isocrates’ dream of Panhellenism. The Church Fathers found in the rhetoric of the Second Sophistic a way of rehabilitating the eloquence of scripture and, in doing so, of helping their fellow Christians to achieve an identity of their own. What is perhaps most striking about this rhetorical movement is the fact that it was almost exclusively Greek, in spite of the dominance of Latin Rome over the entire Mediterranean basin. Even Favorinus, from the Gallic city of Arles, composed and delivered his speeches in Greek. In the Second Sophistic, then, we see no attempt to adapt to the culture of Rome, but a reassertion of Greek cultural values as a unifying force in an empire that was becoming more and more fragmented in the centuries before it collapsed in the west.

Seleucids

Dynasty of Macedonian kings

The name Seleucids refers to the dynasty of Macedonian kings founded by Seleucus I Nicator (c.355–281 BC), one of the successors of Alexander the Great. The dynasty dated its beginning to 312 BC (the start of the “Seleucid era”) when Seleucus recaptured his original province of Babylon and started on a long career of expansion, during which he assumed the royal title in 305/04 BC. The dynasty lasted until 64 BC when it was overthrown by the Roman general Pompey, who created the Roman province of Syria. The name Seleucids is used by only one ancient author (Appian, *Syriake*, 48–50, 65, 67). More commonly the rulers are referred to in ancient writers from the 2nd century BC onwards as either “the kings descended from Seleucus Nicator”, or most frequently as “the kings of Syria”, the “Syrian kings”, the “kings of the Syrians”, but also as the “kings of Asia”; other designations are found as well. None of these territorial designations originates with the rulers, who never described themselves as kings of any particular country or people: the Seleucid empire thus never had a precise territorial definition. The Seleucids are also frequently referred to collectively as “the Macedonians”.

Starting from his province of Babylonia, Seleucus I went on to enlarge his territories steadily, first towards the east and then towards the west. By the time of his death in 281 BC his empire extended from Bactria and the borders of India in the east to north Syria and the eastern Mediterranean, Asia Minor, and even a foothold on the European mainland across the straits. This large empire proved difficult to maintain as a unit, and subsequent rulers were frequently on the defensive against internal and external challenges. Under Antiochus III the Great the empire was able to stage a spectacular recovery, though Antiochus then clashed with the Romans and was defeated by them. The Treaty of Apamea that followed his defeat (188 BC) excluded the Seleucids from Asia Minor north of the Taurus and imposed heavy penalties on them. Of subsequent rulers the best known is Antiochus IV because of his attack on Egypt and rebuff by the Romans (168 BC), and especially because of his failed attempt in 167 BC to ban Judaism at Jerusalem. This is recounted at length in the Jewish tradition (Daniel, 1 and 2 Maccabees) on which Antiochus IV made a profound impact, but receives scant mention in the extant Classical sources (Diodorus, 34. 1; Tacitus, *Histories*, 5. 8. 4–5). After his death in 164 BC the dynasty was increasingly prey to internal dynastic conflicts as well as external intervention. With the defeat and death of Antiochus VII in his Parthian expedition of 130–129 BC the dynasty ceased to play a significant role on the international scene.

The Seleucid contribution to the Hellenic tradition is not easily assessed. The court history that once existed is lost, and other contemporary accounts are incompletely preserved if at all; hence reliance must be placed on later and thus derivative writers, whose ultimate sources are largely unknown. Only two of these give a continuous, but sketchy, account of the history of the dynasty as a whole (Appian's *Syriake*, 2nd century AD; Justin's *Epitome* of the *Philippic Histories* of Trogus Pompeius, 3rd century AD). Whereas Alexander the Great attracted much attention under the Roman empire, the Seleucids were apparently largely neglected apart from their continued reputation in north Syria, especially at Antioch, and were often thought of as kings who had not stood up to Rome. Plutarch's general lack of sympathy for the kings after Alexander is also a relevant factor, as shown by his choice of biographies. The presentation of the Seleucids in the extant literary sources diverges. In one tradition, most clearly represented in the 4th century AD by Libanius of Antioch (*Antiochicus*, 11 especially 100–04; written in AD 360), Seleucus I in particular is presented encomiastically as having extended the Greek world in the east through his city foundations (notably Seleuceia on the Tigris, and the four cities of Antioch, Seleuceia in Pieria, Laodicea, and Apamea in north Syria). Among these, Antioch in particular continued to flourish after the end of the Seleucids as one of the leading cities of the eastern Roman empire. Other writers, dating from the 3rd century BC onwards (Phylarchus, later Posidonius), presented the dynasty negatively as an example of “oriental despotism” and “eastern decadence”. This pejorative colouring was further emphasized by Roman propaganda at the time of the conflict with Antiochus III (cf. the speech of the Roman commander Manlius Vulso in 189 BC in Livy, 38. 17: “the Macedonians who hold Alexandria in Egypt, who dwell in Seleuceia and Babylonia and in other colonies scattered throughout the world, have degenerated into Syrians, Parthians, Egyptians”). The presentation in Justin's *Epitome* follows this predominantly negative view of post-Alexander history. In practice it is very unlikely that the Seleucids had any general programme of “Hellenizing” their empire; the action of Antiochus IV at Jerusalem seems to have been strictly local in character (despite 1 Maccabees 1.41), and was in any case soon rescinded. The aims of the kings were probably imperial and dynastic rather than specifically Hellenic. Modern approaches to the Seleucids have fluctuated. In the early 20th century they were presented as champions of Hellenism in the east (E.R. Bevan, A. Bouché-Leclercq, E. Meyer). After World War II Seleucid history was studied increasingly from an eastern perspective, and the Seleucids were presented as continuators of the Persian empire whose centre of

gravity lay in Babylonia rather than in the west (P. Briant, A. Kuhrt and S. Sherwin-White), though the approach is controversial. The true identity and orientation of the Seleucids thus remain a matter of dispute.

Macedonian in origin but Greek in culture, the Seleucids used Greek as the language of the court. Their abundant coinage is purely Greek in style, types, and inscriptions, and makes no concession to the eastern world. On the other hand the Seleucids were able to identify at Babylon with native traditions of kingship, and there is much Babylonian evidence for their activity there, though unlike Alexander they made no attempt to connect themselves directly with Persian royal traditions. The Seleucid record in the patronage and promotion of Greek culture appears to be much more limited in all fields than that of the Ptolemies (their rivals) or of the Attalids, and there was no Seleucid equivalent in the cultural field to Ptolemaic Alexandria or Attalid Pergamum. No Seleucid ruler acquired the reputation of being a patron of the arts. This in itself may help to account for their more modest reputation in the general Hellenic tradition.

Serres

City in Macedonia

With a population of 50,390 according to the 1991 census, Serres is one of the most populous towns of Greek Macedonia, the second largest in east Macedonia after Kavalla, and capital of the administrative department of the same name. The town's position remains the same as when it was first recorded in antiquity; it occupies the southern slopes of Mount Menoikion, while a vast plain extends to the west and south. Not far from the town, at a distance of about 12 km, flows the Strymon river, a dominant feature of the region. Serres lay close to the Via Egnatia, one of the most important land routes in Roman, Byzantine, and Ottoman times, which linked Thessalonica to Constantinople (modern Istanbul). The development of Serres was much affected by its proximity to that major route.

The first record of the town is connected with events of the 4th century BC. It was probably founded by the Thracian tribe of Odomantes under the name of Sira or Siris, which was later transformed in Serrai/es (the Ottoman Turks knew it as Siroz). Originally a Thracian settlement, it was open to the influences of Hellenic civilization that came from the Greek colonies on the east Macedonian coast. The process of Hellenization was accelerated and finally completed after the region was annexed to the Macedonian state by Philip II between the years 358 and 355 BC. From 146 BC onwards the region of Serres was incorporated in the Roman province of Macedonia. Christianity was introduced to the region by St Paul,

who visited the nearby towns of Philippi and Amphipolis and established a Christian church there. In late antiquity the bishop of Serres was a subordinate of the metropolitan of Thessalonica.

Ships and Shipping

The Greeks of antiquity lived mostly near the sea; the fact and its significance were not ignored (Aristotle, *Politics*, 1271b34). The influences that formed their culture were seaborne as was its own diffusion; their literature from its earliest pages has references to the sea, to ships, and cargoes. The Greeks of the Middle Ages have been described as suspicious of the sea and of commerce. Nevertheless a Byzantine of the 14th century reportedly considered that his city should become a purely maritime commercial power (John Kantakouzenos, *Histories*, 2. 537). In the contemporary world merchant shipping is one (perhaps the only) commercial activity in which Greece is internationally prominent. The Greek-owned merchant fleet is now the largest on earth; members of a nation accounting for about 0.2 per cent of the world population apparently control about 15 per cent of its maritime carrying capacity.

Such facts create an understandable temptation to see a continuity of maritime genius and to stress its importance in the history of the Greeks. To this some writers have succumbed despite difficulties that should encourage resistance. A number of centuries before the 18th are an almost complete blank. From other facts (these include the Italian basis of the modern Greek maritime argot, the very unsettled conditions in the Aegean during part of the period, the feeble representation of maritime Greeks in surviving commercial documents of late Byzantine times, the known maritime strength of other nations, and the beginnings, so far as documented, of the maritime adventure of the 18th century) it may be suspected that the blank reflects reality rather than lack of evidence or diligence in collecting it. In addition it is not only difficult to assess the importance of shipping but the approach to the difficulty must differ for different ages.

The physical characteristics of ancient ships may be inferred from surviving descriptions, depictions, and wrecks. By the 5th century BC merchantmen and warships were clearly distinguished. The former were known as “round ships” (*strongyla ploia*) or *holkades* or (in the Phoenician context) *gauloi*, the latter simply as ships (*nees*) or long ships (*nees makrai*) or with reference to a specific type *pentekontoroi* (ship with 50 oars) or *triareis* (trireme). The distinction was not only in beam but also the principal means of propulsion, which for merchantmen was sail and for warships, at least in battle, oars. Use of pentekonters by the Phocaeans on their journeys to the west seemed to the 5th century remarkable (Herodotus, 1. 163) and reference to oared merchantmen (Thucydides, 4. 118. 5) is extremely unusual. The date of this functional specialization between speed and capacity is obscure. The earliest surviving picture of a round ship on a pot is from the late 6th century BC (British Museum, London); if the surprise of Herodotus was shared by contemporaries of the events, then round ships should have existed by its earlier years.

The construction of Mediterranean ships, as appears from their wrecks, had certain common features between the late Bronze Age and the end of antiquity. The hull planking is held together by mortice and tenon joints locked with tree nails. In construction the shell would have been built first and the frames added afterwards. The advantage of this method is a very firm hull. Its disadvantage is the skill and time required for the adzing and jointing of the timbers. It seems to have given way to skeleton-based construction (in which the integrity of the hull depends on fixing its planking to the frames) by the 7th century AD. Oak was used for the keel and frequently the frames, fir or pine for the hull planking. Hulls were caulked and often sheathed in metal, lead being found more than copper.

Most merchantmen were single masted with a single square (strictly, rectangular) sail. The sail's angle to the mast could be adjusted and it could be flexibly brailed. Some later ships also had a foremast with a smaller sail. Three-masted vessels must have been very rare. Rudders were oar-shaped and projected astern from one or both sides of the hull.

The capacity of merchantmen may be judged from indications of their cargoes or their dimensions. The stone for some archaic statuary or masonry was carried by sea; there are surviving statues of more than 20 tons and blocks of more than 30. Round ships could carry considerably more. Gifts of grain to Athens in the late 4th century BC are attested in quantities of 3000 *medimnoi* (c.120 tons) and less frequently of 4000 *medimnoi* (c.160 tons) and they are plausibly whole shiploads. The 3000 wine jars that were the cargo intended in [Demosthenes] 35 are likely to have exceeded 100 tons. A decree from

Thasos of the 3rd century BC excludes ships carrying less than 3000 talents (c.80 tons) from one harbour and less than 5000 talents (c.130 tons) from another. There is evidence of much larger cargoes. Privileges in the Roman period were available in respect of vessels carrying at least 50,000 *modii* (c.340 tons) of grain (*Digest*, 50. 5. 3) and there are wrecks of the Roman period with more than 400 tons aboard. The vessel that brought the Vatican obelisk to Rome must have been able to carry around 1300 tons (for the ballast see Pliny, *Naturalis Historia*, 16. 201); vessels with such dimensions seem from the tone of Pliny's reference to have been unusual enough to provoke wonder (cf. The *Navigium* of Lucian for the wonder that a ship of enormous dimensions could provoke). The largest vessel that is known (through a description reproduced by Athenaeus, 206ff.) from antiquity was built in the 3rd century BC for Hiero of Syracuse; its size has been estimated at around 2000 tons. The largest vessels of antiquity thus approached the limits of purely timber construction. It was not until the 19th century that ships became substantially larger. Passengers in considerable numbers are recorded on long-distance voyages: 600 from Palestine to Rome (Josephus, *Vita*, 15) and 276 (including crew) on the ship that took St Paul as far as Malta (Acts 27: 37), this at the extremity of the sailing season.

The speeds of which ancient ships were capable were less important than the fact that they were at the mercy of the winds and weather (the discovery of the periodicity of the monsoon was for this reason very important for Indian Ocean traffic) and that in winter navigation generally stopped (this defined what journeys could be undertaken). A replica of the Kyrenia wreck (c.300 BC) has reached 9 knots under sail and records of remarkably fast voyages show that speeds of 5 knots or more could be averaged over several hundred miles. Conversely on a voyage against the prevailing wind a ship was doing well to average 2 knots. The prevailing direction of the winds defined the expected journey times of ancient travel (e.g. fast from the northwest towards Egypt but slow in the opposite direction) and the superimposition of a short sailing season further limited the possibilities. The risks in pushing one's luck with the seasons are accessibly exemplified by Acts 27–28; the story of Paul's journey to Rome is one of the most vivid records (Synesius, *Epistles*, 4 vies with it) of the vagaries of an ancient sea voyage.

As in the modern world, it was much cheaper in antiquity to transport goods over water than over land; to quote a classic inference from the Diocletianic price edict, "it was cheaper to ship grain from one end of the Mediterranean to the other than to cart it 75 miles". Nevertheless, the function and significance of shipping in antiquity are controversial; the divisions in the controversy are aligned with those

on the nature of the ancient economy generally. That contradictory accounts of, say, trade in the Archaic period or lending in Classical Athens are pressed on the public with equal conviction is partly due to the nature of the evidence: fragments that may be fitted into different pasticcios whose shape owes more to the restorer than to them. Even apparently elementary questions (e.g. how many of the maritime lenders known from Athens in the 4th century BC were Athenians and/or merchants?) receive different answers because of the opacity of sources that were not composed to satisfy the curiosity of modern scholars. By and large, rival interpreters have not attempted a reconciliation of their differences and the diversity of their views cannot be conveyed in a brief entry.

From the 4th century BC organizational features of shipping that were to endure for centuries (even to the present day) are clearly discernible. Much less can be discerned about earlier periods; this is doubly unfortunate because Greek seafaring created its most important and enduring monument in the vast diffusion of people and culture of the Archaic period. The mere existence of maritime adventures is easy to establish from a variety of sources: stories in Herodotus (e.g. the fabulous wealth gained by Colaeus of Samos and his crew as a result of an unintended voyage to Spain at 4. 152 or the journeys of the Phocaeans in the far west at 1. 163), the remains of trading settlements at, for example, Naucratis in Egypt (see also Herodotus, 2. 178f.) or Al Mina on the Orontes, fragmentary business documents recovered from trading posts of the outer fringes (Berezan on the north coast of the Black Sea and Pech Maho in the west). Since colonists did not set out for the unknown (Herodotus, 4. 150. 4), their choice of destination depended on information brought back by seafaring adventurers.

To picture their adventures, scholars have turned to the *Odyssey* (the earliest reference to seafaring, Hesiod's advice at *Opera et Dies* 618–94 being concerned with less ambitious journeys) assuming that it is, even when the characters are telling lies as at 14. 192–359, in background realistic. Attention is drawn to the commonality of the enterprise (necessary when a leader needed oarsmen and linked to a historical datum such as the dedication of Colaeus and his crew together) and its close association with the exchange of gifts or prestige goods on the one hand and raiding and abduction on the other. A precisely focused picture is impossible; despite elaborate attempts, the basis, for example, of the distinction between the high status of a *Mentes* (actually *Athena* in disguise) in search of copper in exchange for iron at 1. 179ff. and the low status of a trader mindful of his cargo (8. 159ff.) is elusive. It has been suggested that by the end of the Archaic period the wealth of some cities (e.g. Aegina) depended

on seaborne commerce.

The 4th century ^{BC} reveals a clear separation between hull and cargo interests and the finance of cargo by bottomry loans (under which repayment was contingent on the safe arrival of ship and cargo), a financial device that was to endure into the modern world. There is evidence of elementary economic rationality in, for example, the stipulation of maritime lenders that the cargo was to be worth twice the loan and that the borrower was to borrow no additional sums from others, or the diversion of a grain cargo to a port at which prices were higher (Demosthenes, 56). That hardy perennial, the maritime fraud, also heaves into view (Demosthenes, 32). The status and wealth of the participants and the scale and significance of their activities have been much debated. By and large, throughout antiquity, the masters of vessels and the merchants who travelled with them were of low status and for the most part their means were also modest. When, in the case of late antiquity, comparisons are possible, even the largest merchant fortunes are dwarfed by landed wealth. Arguments from silence indicate the same for earlier periods. The capital, though, for the business either in the form of bottomry loans or even ownership of vessels seems throughout antiquity to have been provided by persons (and later institutions such as the Church) of wealth and status. The amount of maritime activity in antiquity cannot be quantified. On the demand side certain large cities (in chronological order Athens, Alexandria, Rome, and Constantinople) imported a significant proportion of their grain needs over water and attracted delivery of luxuries over considerable distances. On the supply side it is difficult to identify cities for which maritime activity was in itself significant. In the Classical period Aristotle names Aegina and Chios (*Politics*, 1291b24); Phaselis is also possible, later Rhodes is a clear example; with cities such as Alexandria (or for instance Nicomedia in the Roman period) it is hard to tell the relative importance of the maritime activity attested.

The strictly economic effect of maritime activity in antiquity may have been slight, the social status of its participants low by comparison with their counterparts today, and most detail of its organization obscure. These facts do not contradict the assumption of a much wider significance for shipping in antiquity. Already by the 4th century ^{BC} a city's access to the sea had effects notable enough for its merits to be the subject of debate (Aristotle, *Politics*, 1327a11ff.). Throughout antiquity ships were the uniting link in the Mediterranean world.

In the 8th century ^{BC} Hesiod's father went to sea leaving behind not wealth and prosperity but poverty (*Opera et Dies*, 637–38). The earliest passage on ships and shipping in Greek literature expresses an

enduring truth. Poverty pushed the Greeks to sea in the modern period as well, and is now pushing others to replace them.

Sicily

Greek colonization of Sicily began in the second half of the 8th century BC. Information about Sicily's indigenes is based upon archaeology and the untrustworthy evidence of later Greek and Roman writers. Thucydides (late 5th century BC), who took his information from an earlier contemporary Antiochus of Syracuse, whose history of Sicily stretched from the earliest period to 424 BC, relates that the first settlers, if Homer's Cyclopes and Laestrygonians are excluded, were the Sicans, who claimed to be autochthonous, though Thucydides considered them migrants from Iberia. After them came refugees from Troy who settled at the western end of the island, where they later intermarried with Phocian Greeks driven there by gales at sea and became the Elymians, whose cities were Eryx (now Erice) and Segesta. Then, some three centuries before the Greek colonists arrived, the Sicels migrated from Italy, and gave the island its name.

Archaeology shows modest trade for 1400–1200 BC between mainland Greece and eastern Sicily, and yields no evidence for connections with Minoan Crete, in spite of the legend of King Minos' expedition against the Sican king Kokalos, which resulted in a settlement on Sicily by Cretans who found their retreat cut off. The period of destruction and migration c.1200 BC which affected the whole eastern Mediterranean and Italy left traces on Sicily as well. But the "Urnfield" culture which is found in central Italy c.1000 BC does not appear in Sicily, and archaeology fails to corroborate the tradition of Sicel emigration from the mainland.

The first Greek settlement in the west was not in Sicily, but on the island of Ischia off the bay of Naples c.770 BC, followed on the

mainland some two decades later by Cumae, some 14 km west of Naples. About the same time, the first colony in Sicily, Naxos, was founded on a headland below Taormina, which was the first landfall a sailing ship coasting eastward along the toe of Italy would reach. Then in rapid succession colonies were planted at Leontini, Catana (modern Catania), Syracuse, Zancle (soon renamed Messina), and Megara Hyblaea. Finally, in 688 BC, Gela was founded on the south coast. The founding city states were Chalcis on Euboea, which founded the four most northerly colonies, Corinth, which founded Syracuse (734–733 BC), Megara (Megara Hyblaea), and in the case of Gela the settlers were Greeks from Rhodes and Crete.

The subsequent history of these settlements varied: Syracuse with its splendid harbour became the greatest city in Sicily, while little Megara Hyblaea was razed c.483 BC and its population deported to Syracuse, the wealthy to be absorbed as citizens and the poor to be sold as slaves. Colonies themselves, once established, might send out colonies: Megara Hyblaea founded Selinus (modern Selinunte) in 628 BC, a century after its own foundation, and Gela founded Acragas (modern Agrigento) in 580 BC. Messina founded Himera on the north shore, and Syracuse founded Camerina on the south coast and two inland colonies, Acrae and Casmenae.

The two chief reasons for a city to send out a colony were the promotion of trade and the attraction of arable land, though there were subsidiary reasons in some instances, such as repeated crop failures, or an effort to dispose of potentially troublesome citizen groups. The 8th century BC saw a surge in population in Greece, as well as increased urbanization, marked by the development of the Classical polis (city state) as the unit of government. The pacesetters were the Greeks on the island of Euboea, where the two chief poleis, Chalcis and Eretria, cooperated in founding the first colony in the west on Ischia; but by mid-century Chalcis and Eretria were at war over ownership of the Lelantine Plain in Euboea, and Eretria, the loser, was sidelined. Corinth, an ally of Chalcis in the Lelantine War, was not far behind, and pottery from Corinth was to dominate Sicilian markets until the mid-6th century BC, when imports from Athens displaced it. Colonial foundations were state ventures: the government of the founding city organized the venture, usually consulting Apollo's oracle at Delphi first, and, with the oracle's approval and advice, it chose the colonists, generally unmarried men, and selected a "founder" (*oikistes*) who brought coals from the altar of Hestia in the mother city to light the hearth fire of the new foundation. Once arrived in Sicily, the colonists would acquire territory for themselves, preferably by peaceful means, and divide it into parcels (*kleroi*) for themselves. An urban centre was laid out with an agora as a place for commerce and

city government, which, like contemporary polities in Greece, would be an aristocracy. The colony became itself a polis, politically independent, though it might be bound to its mother city by ties of sentiment, and if it in turn founded a colony, it generally invited a citizen from the mother city to serve as *oikistes*. Religion, too, came to the colonies as aristocratic possessions; at Megara Hyblaea, for instance, a century passed before a public temple was built in the agora.

The attitude of the native Sicels and Sicans to the Greek invasion varied. At Megara Hyblaea a Sikel king, Hyblon, helped the colonists find a site on his territory after their first attempts failed. Possibly he hoped for a buffer between his kingdom and Syracuse, for the Corinthian colonists led by their *oikistes* Archias seized their site by force, and once established, Syracuse reduced the Sicels in their territory to serfs called Killyrioi. The native policies of the Dorian Greeks differed from those of the Chalcidian foundations, which maintained generally friendly relations with the Sicels. But both Syracuse and Gela were assimilationist: Gela expanded at the expense of the Sican chiefdoms, and Hellenized as it expanded, and its foundation of Acragas in 581 BC marked the culmination of its westward advance into Sican territory along Sicily's southern shore. There was little overt native resistance to Hellenization, though in the mid-5th century BC a Sikel chief named Ducetius tried to launch a national movement, and captured an outpost of Acragas c.450 BC. But Syracuse came to Acragas' aid; Ducetius was defeated and exiled to Corinth, and though he returned and founded a city at Caleacte (modern Caronia Marina), he was no further threat to the Greeks.

The physical remains of Greek Sicily furnish impressive evidence for great wealth in the 6th and 5th centuries BC. On the acropolis of Selinus are the ruins of four Archaic temples and on a low hill to the east are three more, of which the 5th-century "Temple G", measuring 50 × 110.4 m, is one of the largest temples ever built. Yet it was rivalled by the great temple of Olympian Zeus at Acragas. The growing wealth and population brought with it social unrest, and the names of various early tyrants have survived: Acragas had the dictator Phalaris (c.570–555? BC) whose cruelty was legendary: he was said to have a hollow bronze bull in which he roasted his enemies, and their cries issuing from the bull's mouth sounded like lowing! Historical sources become firmer by the end of the 6th century BC. At Gela two brothers, Cleander and Hippocrates, sons of an Olympic victor, ruled in succession from 505 to 491 BC, and after Hippocrates died in battle with the Sicels, his cavalry commander Gelon, son of Deinomenes (hence the name "Deinomenid" for the dynasty), succeeded, first as protector of Hippocrates' sons and then as tyrant in his own right. In

485 BC Gelon captured Syracuse where the aristocratic landowners, the Gamoroi, who had been driven out by the commons allied with the Killyrioi, had appealed to him, thereby giving him an opening. Then he transferred to Syracuse more than half the population of Gela which he entrusted to his brother Hiero, and rapidly added Gamarina and Megara Hyblaea to his empire as well. Theron, tyrant of Acragas (488–472 BC), became an ally early in Gelon's career and gave his daughter Demarata to him as wife. The Theron–Gelon power bloc was ominous enough that when Theron took Himera, expelling its pro-Carthaginian tyrant Terillus, Carthage, which had planted footholds in western Sicily first at Motya, then at Panormus (modern Palermo) and Drepana (modern Trapani), reacted by mounting a major invasion which was utterly defeated at Himera by Gelon and Theron. A temple of Victory was built on the battle site at Himera, and a twin was built in Syracuse, where it still survives as the cathedral of the city. The Carthaginian attack took place in the same year, 480 BC, as the Persian invasion of Greece, and Pindar in his first *Pythian* written ten years afterwards in honour of a victory by Gelon's heir, Hiero, in the chariot race in the Pythian Games at Delphi, associates the victory at Himera and the Persian naval defeat at Salamis under the common motif of saving Hellas from slavery, while Herodotus reports a Sicilian tradition that the two victories were on the same day. This seems to have been the beginning of the myth that made Carthage a western outpost of orientalism, which in concert with Persia sought to extinguish western civilization at its birth.

Under Hiero, the Deinomenid dynasty rapidly lost its popular support, and his brother Thrasybulus, the next tyrant, was expelled by the Syracusans with support from Acragas, Himera, Gela, and Selinus, with some Sikel help. The following years in Sicily marked a democratic interlude, though political life remained turbulent, and there was sporadic warfare among the cities. In Greece itself, Athens emerged from the Persian Wars with a sea-based empire which showed an interest in Sicily, but it was not until after the Peloponnesian War between Athens and Sparta broke out in 431 that Athens undertook military intervention. In 427 BC it sent 20 warships to help Leontini against Syracuse; apparently its motive was to block grain exports to Sparta's allies in the Peloponnese. In 415 BC Athens again dispatched a large expedition on a Sicilian venture, ostensibly to help the Elymian city of Segesta against its neighbour Selinus. But its forces became bogged down in a siege of Syracuse and in 413 BC they were completely destroyed. Yet the Athenian intervention had disturbed the balance of power in Sicily, and Carthage, which after its defeat at Himera had remained at peace, intervened, whether from opportunism or because it thought its interests were threatened. In

410 BC it grasped an appeal from Segesta which was again menaced by Selinus. The Carthaginian invasion force destroyed Selinus and Himera in 409 BC, and three years later Acragas fell, followed by Gela and Camarina. In Syracuse, which had been torn by civil strife between the democrats and the moderate oligarchs, the defence was led by Dionysius, who had been a young lieutenant of Hermocrates, the leader of the Syracusan resistance against the Athenian expedition. Hermocrates had been exiled for oligarchic sympathies, and died in a failed coup d'état in 407 BC. Dionysius I was to emerge as the most famous of Sicily's tyrants.

From 405 BC, when Dionysius' career began, until the Roman conquest, Sicily's political history centres around a group of colourful tyrants. Dionysius, whose rule lasted 38 years, was a precursor of the Hellenistic monarchs who dominated the Greek world after Alexander the Great. Like them, he exploited dynastic marriages: he himself took two wives, one a Syracusan and the other from Locri in Magna Graecia, and he arranged political marriage alliances with his daughters. He converted the oldest section of Syracuse, the island of Ortygia, into a fortress for his courtiers and mercenary soldiers, and Greek tradition preserved legends about his elaborate precautions against assassination. He treated neighbouring cities ruthlessly, and bolstered Syracuse's defences with a rampart surrounding the Euryalus ridge which runs westwards from the city for several kilometres and at its western point built a fort which survives as the Castello Eurialo, though it has been much altered since Dionysius' day.

Against Carthage Dionysius fought with varying success: in 396 BC he won an overwhelming victory, aided by plague which broke out among the Carthaginian troops, and he turned back fresh attempts in 393 and 392 BC. But some five years later he suffered a defeat and he was in the midst of a new campaign against Carthage when he died and was succeeded by his son by his Locrian wife. Dionysius II preferred a softer, less active life and made peace.

The involvement of the philosopher Plato with the regime of Dionysius II is a curious adventure, described by Plutarch and by Plato's own *Seventh Letter*. Plato visited Syracuse in 388 or 387 BC and met Dion, the brother of Dionysius I's Syracusan wife. After Dionysius' death, Dion persuaded Dionysius II to invite Plato to instruct him on kingship. Plato made two trips to Syracuse; the first achieved nothing and he left for home in 366 BC, and his second visit, five years later, was equally unsuccessful. He failed to persuade Dionysius to recall Dion whom he had exiled to Greece.

However in 357 BC Dion returned with 3000 mercenaries and expelled Dionysius, but Dion's government rapidly became a disguised tyranny, and in 354 BC he was overthrown and killed by his own

soldiers. Sicily lapsed into anarchy which not even the return of Dionysius II in 347 BC could quell, and, faced with a renewed Carthaginian threat, a group of Syracusan exiles appealed to their mother city Corinth, which dispatched the Corinthian citizen Timoleon with ten ships and 700 men to Sicily.

Timoleon's public career in Sicily lasted only from 344 until 337 BC, when he resigned his powers, but during this period he defeated Carthage and forced it back into the west corner of the island, deposed the tyrants in the Greek cities, and set up a moderate democracy in Syracuse. Exiles were recalled, 60,000 new colonists were recruited in Greece, and the ruined Sicilian economy revived. In retirement he continued to be a respected counsellor of the new regime, but his intervention checked Sicily's decline only briefly. In 317 BC an unscrupulous demagogue, Agathocles, led an uprising against the Syracusan aristocrats, who were massacred or exiled and their lands redistributed. He was an astute and restless tyrant; in 310 BC, when Syracuse was faced with a new Carthaginian invasion, Agathocles mounted a brilliant counterattack in north Africa itself, which was initially successful, though in the end (November 307 BC) he had to abandon his army there and return home without it. The following year Carthage retreated to its corner of the island and made peace, and Agathocles spent the rest of his life consolidating his power in Sicily and south Italy.

Agathocles' empire disintegrated at his death (289 BC) and he left an unhappy legacy. His Italian mercenaries, who called themselves Mamertines after their war-god Mamers (Mars), seized Messina and used it as a base to ravage eastern Sicily. When they allied themselves with Carthage against Syracuse, the Syracusans appealed to the king of Epirus, Pyrrhus, who had just defeated the Romans in two costly victories in southern Italy in the employ of Tarentum, but had failed to achieve a profitable settlement and was ready for a new adventure. But Pyrrhus, brilliant tactician though he was, failed to expel Carthage from the island, and the Sicilian cities rapidly grew weary of his pretensions. Pyrrhus retired to Italy, where he lost his last battle against Rome at Beneventum, and Syracuse turned for salvation to one of his former lieutenants, Hiero, by origin a Syracusan. He was proclaimed king after he defeated the Mamertines in 269 BC and his reign lasted until 215 BC.

Rome's first clash with Carthage began in Sicily in 264 BC and the cause was once again the Mamertines. The First Punic War was long and destructive, and Rome suffered terrible manpower losses, but at the end Carthage departed from Sicily, which became Rome's first province. Syracuse, however, remained independent, for Hiero had shrewdly thrown in his lot with Rome, and it was not until the Second

Punic War that Hero's son Hiero II broke off the alliance and switched support to Carthage. The Romans thereupon laid siege to the city, captured it, and plundered it thoroughly. In the last years of the war Sicily became the base for Publius Scipio the Younger's attack on north Africa which culminated in the defeat of a Carthaginian army led by Hannibal at Zama, and when the war was over, all Sicily became a Roman province, paying tribute to Rome and governed by a Roman praetor (later a *pro praetore*), who installed himself in Hiero's palace in Syracuse.

Rome increased Sicilian grain production enormously, but the profits flowed into the pockets of Roman and Italian businessmen who built up large estates worked by slave labour. Two slave revolts, which were rare in the ancient world, broke out in Sicily under the Roman Republic, one in 139 BC which lasted seven years, and the other in 104 BC. The revolts did little damage to the cities, however, but the same cannot be said for the misrule of the propraetor Gaius Verres (73–70 BC) whose spoliation of Sicily is described vividly in Cicero's *Verrine Orations* which were published after Cicero prosecuted Verres for corruption before a senatorial court and forced Verres to go into exile without attempting a defence. The civil war which followed Julius Caesar's assassination also hurt Sicily, which was held by Sextus Pompeius for seven years during his struggle with Caesar's heir Octavian, the future emperor Augustus, and this was one factor in the decline of Sicilian wheat production, for Sicilian grain was cut off from its market in Rome. With Augustus, Sicily drew closer to Italy: he gave the Sicilians "Latin rights" and planted colonies of Latin-speaking army veterans at Syracuse, Palermo, Tauromenium, Tyndaris, Catana, and Thermae. In AD 212 all the islanders became Roman citizens.

Siegecraft

Whatever its historical validity, the Trojan War and its traditional length of ten years argue for an almost total lack of siegecraft in the Late Greek Bronze Age. That determined attempts were made to take cities, however, is indicated by the massive fortifications of the time (most notably at Tiryns), and that these attempts were mainly directed at the weakest points, the gates, is demonstrated by the existence, as at Mycenae, of a bastion to enable the defenders to hurl missiles at the unshielded left side of the attackers. Furthermore, although the battering ram is first known from Assyrian reliefs of the 9th century BC, it has reasonably been speculated that one with a reinforced head and slung beneath a wooden frame may lie behind the tale of the wooden horse.

Whereas in the Late Bronze Age only the king's palace and its immediate vicinity were fortified, the polis (city state) that emerged at the end of the Dark Age demanded protection for its much larger urban centre. It was, however, only in the late 6th century BC, against the Persian threat to Greek settlements in Asia Minor, that attempts were made to embrace with walls whole cities (and by the 4th century BC agricultural land as well), and not until the 5th century BC that numerous towers were built to facilitate the hurling of greater concentrations of missiles. However, even insubstantial walls were generally sufficient to withstand most hostile attacks. With the exception of a few very small places (e.g. those captured by Brasidas in Chalcidice), treachery and starvation consequent on circumvallation were the engines of capitulation. This situation was probably due to contemporary emphasis upon the hoplite at the expense of archers and slingers who could have afforded covering fire for the attackers. Nevertheless, expertise in the design and placing of walls and counterwalls by besiegers and besieged made considerable advances (well illustrated in the Athenian siege of Syracuse in 415–413 BC, Thucydides, 6. 63–7. 87).

Siege engines, however, did make a tentative appearance. Rams and “tortoises” (protective sheds) built by a certain Artemon of Clazomenae were introduced by Pericles at the siege of Samos in 440 BC, but Diodorus (12. 28. 3) gives no details. Similarly Thucydides merely mentions (2. 58. 1) “machines” used unsuccessfully by the Athenians at Potidaea in 430 BC. He does, however, describe at great length (2. 75–78) the siege of Plataea in 429–427 BC. The mound built

by the attackers against the city wall was countered by the erection on that wall of a wooden frame filled with bricks by workmen protected against flaming arrows by screens of hides. The defenders also knocked a hole through the bottom of their wall to withdraw earth from the mound (an action countered by the Peloponnesians' plugging of the gap with heavy reed baskets of clay), and subsequently they tunnelled underneath to remove loose earth from the bottom of the mound. They further built a crescent-shaped inner wall at this point, a tactic which was to become standard. The blockading Peloponnesians for their part failed to break through with battering rams, because the Plataeans raised up the heads with nooses or snapped them off with beams let down from chains. The attackers' incendiary attempt with faggots piled up against the wall and kindled with brimstone and pitch failed, however, only through rain and the absence of a favourable wind. They consequently resorted, ultimately with success, to circumvallation and resultant starvation. "Machines" on board ships were nevertheless instrumental in capturing two towers on the Megarian island of Minoa in 427 BC (Thucydides, 3. 51. 3); and fire was successfully employed, though only against the palisade of a garrison, at Delium in 424 BC when it was driven through a pipe by bellows (Thucydides, 4. 100).

Huge advances were made in the 4th century BC in siege engines and artillery. Siege towers, possibly learned from the Carthaginians, and arrow-firing catapults, possibly an Assyrian invention, were already being used by Dionysius I of Syracuse at Motya in 397 BC (Diodorus, 14. 48–53), and by the time of Alexander's sieges of Tyre and Gaza in 332 BC siege techniques and machines, including stone-throwing catapults, almost always gave the attackers the upper hand. An eminently sane treatise from the middle of the 4th century BC by an author known today as Aeneas Tacticus (probably the Stymphalian general Aeneas) gives a sobering picture of the strains of a city under siege. It details such things as the organization of guards, scouts, patrols, sorties, and passwords, the smuggling in of weapons, proclamations to the citizenry, the threat of plots, the allaying of panic, and the contrivances needed to counter siege engines, artillery, and sapping. This formidable legacy of technical knowledge was further developed throughout the Hellenistic period. This can be seen, for instance, in Diodorus' account (20. 81–88, 91–100) of the siege of Rhodes in 305–304 BC, which gave its protagonist Demetrius I of Macedon his soubriquet Poliorcetes ("Besieger"), and descriptions (Polybius, 8. 3–7; Plutarch, *Marcellus*, 4–17) of Archimedes' innovations at Syracuse in 213–211 BC.

Technical details of artillery come from four ancient authors. The earliest, a treatise of c.240 BC by Biton, supplies instructions for

mechanics and includes valuable details on advanced nontorsion catapults. The work of Philon of Byzantium from c.200 BC gives critical descriptions of standard and novel torsion catapults. Vitruvius, the Roman architectural writer (c.25 BC), is useful for giving highly detailed dimensions, which he probably found in Greek sources. Of Heron of Alexandria in the late 1st century AD there survive two works, one (*Belopoiika*, probably derived from the lost works of Ctesibius of Alexandria) mainly valuable for its descriptions of early non-torsion and torsion catapults, the other (*Cheiroballistra*, but the title may be corrupt) detailing a contemporary torsion weapon with an all-metal frame.

The earliest catapult, the *gastraphetes* ("belly-bow"), had a concavity at the end of the stock which was held against the stomach. An arrow placed in a groove was fired by means of what amounted to a composite bow, whose manipulation was aided by ratchets, pawls, and a triggering mechanism. Its effective range of possibly 200–250 m was somewhat superior to that of the hand-held composite bow (itself known from the Bronze Age). It was subsequently enlarged and furnished with a base to stand on the ground, a universal joint for efficient aiming, and a winched pull-back mechanism, and it could be adapted for stone-throwing. Though superseded by the late 3rd century BC, non-torsion machines reappeared in the 4th century AD and spawned the medieval crossbow.

Probably around 340 BC there appeared also the superior torsion weapons in which, effectively, the composite bow was replaced by wooden arms inserted into "springs" of twisted sinews (and occasionally hair). Of two sorts, the *euthytone* to fire arrows, and the *palintone* to hurl rocks, these swiftly became superbly engineered machines, each being optimally designed for the length of arrow or weight of shot. They could project also incendiary bombs consisting of pitch, sulphur, tow, etc. packed into pots (and, if sources are to be believed, on one occasion, by Hannibal, even live poisonous snakes). The *polybolos* ("multithrower") described by Philon had an ingenious ammunitionfeed for rapid firing. Such engines were used by besiegers and besieged from the ground, walls, siege towers, and ships. The maximum range, at which point accuracy was much impaired, was probably around 500 m. The main defence was padding on the walls to soften the impact of rocks, while the Tyrians erected on their walls mechanically rotating multi-spoked wheels to deflect Alexander's arrows.

Although circumvallation was still commonly practised, sometimes (and often by the Romans) with an outer wall to protect the attackers from a relieving force, offensive weapons besides artillery were also improved. Siege towers reached massive proportions under Demetrius

Poliorcetes, his nine-storey monster at Rhodes being c.45 m high. On huge pivoted wheels, it was strongly protected and even furnished with mechanical shutters over the catapult ports. His rams too were massive, the largest being c.55 m long. Rams were frequently sheathed in iron and their points could be specifically designed to wreak maximum damage on stone walls or wooden gates. The larger ones were sometimes mounted on rollers and many were slung from a penthouse roof by ropes. One such early penthouse of Alexander was surmounted by a 9-m tower to house a small catapult and pots of water to extinguish fires. Scaling ladders were improved, some being protected by attached shields and others mechanically operated. Sapping and counter-sapping techniques developed, including timbered galleries and devices for detecting tunnels, while at the siege of Ambracia in 189 BC pungent smoke was driven in the diggers' faces through an iron tube by means of bellows. Against blockading ships defenders could use submarine stakes in the virtually tideless Mediterranean and fire-ships (as famously at Tyre) while, according to a perhaps over-imaginative tradition, Archimedes employed grappling hooks on chains to lift and catastrophically release ships' prows and also set smaller boats on fire by concentrating on them the sun's rays reflected from shields.

Apart from improvements in architecture the main advances in siegecraft during the Roman period were in artillery, in the introduction of the *cheiromballistra*, and, by the 4th century AD, the one-armed stone-throwing torsion *onager*.

Silk

Silk is a luxurious fabric; it was called *serikon* because it was made by the Seres, the Indian people from whom wild silk was first purchased

by the ancient Greeks. The Latin word *Seres* later came to mean the Chinese, when domesticated silk began to be imported from that country as well.

One type of silk fabric from northern India is called “tussah”, or wild silk, and comes from the silkworm called the *Antheraea mylitta* of the family *Saturnidae*. This caterpillar, not needing to be domesticated, feeds on different types of leaves, including oak, and produces short fibres of a brown or yellow colour, that result in a fabric less fine and strong than domesticated silk. The date at which silk was first worn or produced in the ancient Near East and Greece remains a mystery, due to the perishable nature of cloth and the lack of precision in the ancient references about it. Biblical references (Ezekiel 16: 10 and 13) to silk and Herodotus’ remarks (1. 135) about Median cloth probably refer to wild silk from India. Aristotle seems to have known something of silk processing (*Historia Animalium*, 5. 19. 6). In Hellenistic times a fine transparent cloth was produced called mussel silk, alluding to the threads by which a mussel attached itself to rocks, and most likely made from a mixture of Egyptian linen and Indian wild silk.

The thread of “true” silk, from China, is produced from the cocoon of the domesticated caterpillar, or silkworm, of the moth species *Bombyx mori* of the family *Bombycidae*. This thread is extremely long since the cocoon is spun with one continuous filament and can be woven into a fabric that is prized for its ability to be smooth, thin, and flexible, as well as strong and readily acceptable of dye. According to Chinese tradition, silk production was known from the Neolithic period and originated with Hsi-ling-shi (or Lei-tsu), the 14-year-old bride of the emperor Huang Ti. The legend credits her with the first knowledge of sericulture or the raising of silkworms. Silkworms were selectively bred until they were enfeebled, easily susceptible to temperature changes, unable to walk, and dependent on human attendants to feed them large quantities of fresh chopped mulberry leaves. At maturity the caterpillar spins a cocoon consisting of one very fine, long (500–1000 m) silk thread. The cocoon is then steamed with the caterpillar inside to prevent it from emerging and chopping through the thread. Six or eight cocoons are spun together through a water bath with an elaborate reel-and-pulley system to form a thread thick enough for weaving. It takes about 35,000 worms to produce 5 kg of silk.

Sericulture was successfully kept secret and guarded by the Chinese until the Japanese learned about it in AD 300. In the 6th century AD, during the reign of Justinian, two Nestorian monks were reputed to have concealed silkworms in a hollow cane and smuggled them into Byzantine territory, along with the procedures of sericulture.

The silk trade between China and the west cannot be traced with

confidence before 115 BC. In that year the emperor Wu-ti of the Han dynasty initiated trade with Mithridates II of Parthia. Silk thread and cloth, although not the knowledge of its production, would thereafter be exported from China through the Tarim basin, across the top of the Kushan empire in India and, with the Parthians as middlemen, on to the Near Eastern coast, Asia Minor, Greece, and Italy. In exchange for the cloth, according to the annals of the Later Han dynasty, the *Hou-han-shu* (from the 1st century AD), the Chinese traders received gold, silver (both highly desirable due to the lack of such metals in China), precious stones, amber, glass, gold-embroidered rugs, gold-coloured cloth (from Syria and Alexandria), silk cloth of various colours, and fine cloth made from wild silkworms. The reason why the Chinese bought back silk at Merv is because their own silk was a heavy brocade and densely woven. Silk weavers in Syrian cities and Greek islands, such as Cos, specialized in unravelling the Chinese silk cloth and reweaving it into a lightweight, transparent gauze, thereby multiplying the lengths of fabric for sale in Roman cities, increasing their profit, and satisfying the upper-class desire for erotic, sensational fashion. Other fabrics such as flax and wool could also be mixed with it, which the Romans called *subserica* or *transerica*. Cos, in particular, specialized in a purple-dyed silk, famous enough to be called the “Coan purple” by Augustan poets (Horace, *Odes*, 4. 13).

Trade increased with the peaceful conditions of the Augustan era, but Roman authors from the time of the early empire were scandalized by wearers of silk, “clad in which no woman can honestly say she is not naked” according to Seneca. Although Caesar had silk curtains and Caligula, later, was rumoured to have worn silk clothing, many agreed with Tacitus (*Annals*, 2. 33) that “men should not disgrace themselves with silk clothing from the East” and an edict of the Roman Senate in AD 16 prohibited such dress for men. But the gulf between moralistic intellectuals and public desire was vast, and since all four territories along the silk route – China, India, Parthia, and the Roman empire – were peaceful from AD 90 to 130, the Roman empire acquired plentiful supplies of domesticated silk from China during this period, even though it was said to be worth its weight in gold, due to its difficult manufacture, middlemen fees, and long transport from China.

Strabo (15. 693) thought that silk grew on trees and had to be scraped off the leaves. Pausanias (6. 26. 6–9), however, knew that silk came from an eight-footed insect, called by the Greeks the *ser*, and that they were taken care of by the Chinese in special houses; he mistakenly thought that they were fed millet for four years. Missions were sent to China by Maes Titianus and Marcus Aurelius in the 3rd century to acquire more silk and information.

Silver and Lead

Silver and lead were probably among the first metals to be smelted and were used throughout the Copper, Bronze, and Iron Ages. The association of these two metals is fundamentally geological. Silver was valued and used in ancient Greece in exactly the same way as other cultures: for coins, plate, and statuary. Lead was used in its metallic form for anchoring the iron clamps used to secure stone blocks, for covering the hulls of ships, and as sinkers for fishing lines and standard weights. It was added to bronze to improve fluidity in casting and for the patina that such alloys develop. In Roman times large quantities were used for plumbing, cooking vessels, and other purposes. Indeed, lead poisoning may have been a significant problem for the wealthier sectors of the population. White lead (lead carbonate-hydroxide) was used in cosmetics, salves, and medicaments.

The most abundant ore of silver and lead is the lead sulphide called galena, which usually contains 0.1 to 0.4 per cent silver and some gold. This silvery-grey mineral, which breaks easily into cubes, may occur on its own, or associated with copper or iron ores. However, in antiquity the ore first exploited may have been the minerals cerussite or anglesite, earthy, pale-coloured, surface-weathering products of galena. These oxidized ores are commonly richer in silver than galena. Some silver may have also occurred as the native metal, silver chloride and sulphide. However, these more easily smelted ores were probably exhausted by the Iron Age.

The raw ore was first purified by washing – a current of water was directed over the powdered ore and the associated minerals, which are lighter than the lead minerals, were removed. Lead and silver were then extracted from the ore concentrate by roasting with charcoal. If the smelting was done at high temperatures under reducing conditions, the silver in the ore was also extracted into the lead. It was

then separated by cupellation – molten lead was exposed to a stream of air, whereby the lead and other base metals were oxidized. The silver remained as a molten bead on the lead-oxide slag (lithage). This simple process can yield almost pure silver. The lithage was resmelted with charcoal to recover the lead. Gold is also extracted with the silver but seems to have been rarely separated, although the technology certainly existed. The provenance of silver and lead can be determined from the isotopic composition of lead, which is used as a “fingerprint” for different ore regions.

Lead and silver mines were worked at Laurium, south of Athens, as early as Mycenaean times, but the really rich veins were not discovered or exploited before the 5th century BC, when this area became the principal source of silver for Greece. Initially, weathered ores were extracted, but later shafts were sunk into the primary galena ore. The silver produced in these mines was used in the minting of coins which were the source of much of the wealth of ancient Athens. The lead by-product was widely exported throughout the ancient Greek world, and has been found in western Turkey and Egypt. More than 2000 shafts produced about 8000 tonnes of silver and between 1 and 2 million tonnes of lead during antiquity. Activity ceased by the time of Christ, and was only revived late in the 19th century, but this time for zinc and manganese. The mines are now idle.

The primary ore at Laurium occurs as a replacement of marble near contacts with schists. The ore was formed during Miocene times (between 22 and 6 million years ago) from the watery solutions expelled during the crystallization of a granite. These solutions circulated along cracks in the rock until they reacted with the marble and crystallized galena and other minerals. The ore contained up to 50 per cent galena, but little can now be found in the area, testifying to the efficiency of ancient mining.

Siphnos was another source of silver and lead from the Early Bronze Age, a long time before Laurium, but production reached a peak at about the same time. The wealth of the island at that time is borne out by the opulence of their treasury at Delphi, which they built around 530 BC. During the 6th and 5th centuries BC silver, lead, and gold were produced in large quantities, but the mines were soon exhausted, and from then on Siphnos was poor and unimportant. As at Laurium, the ore formed as a replacement of marble by circulating watery fluids. The source of the fluids may have been metamorphism, or a granite pluton that does not crop out on the island.

The mines at Balya Maden (Asia Minor) have been active since Phoenician times. They may have supplied lead and silver to nearby Troy. They were particularly active from 1880–1940 and have produced about 400,000 tonnes of lead since Roman times.

There were other silver and lead deposits of lesser importance that were exploited in antiquity at Thera, Kimolos, Thasos, Mount Pangaeus, Mount Samsun, and Balya Maden (Asia Minor). Minor amounts of silver were produced from the natural gold-silver alloy electrum, especially at Sardis in Asia Minor.

Simonides

Lyric poet of the 6th–5th centuries BC

Simonides was probably born at Iulis, the chief town of Ceos. Most sources set his birth around 557–556 BC (and some c.532 BC). Both he and his nephew Bacchylides, also a lyric poet and also born in Ceos, around 510 BC, were steeped in a cultural tradition marked by the worship of Apollo and Dionysus, which most probably accounts for the intellectual rigour and Bacchic enjoyment that marks their poetry in a way characteristic of lyric poetry of the 5th century BC in its entirety.

Simonides' poetry belongs to the new wave of choral lyric that flourished in the first half of the 5th century BC and which is represented mainly by the extant poems of Pindar, and the fragments of Bacchylides and Simonides himself. Simonides' artistic production, spanning the second half of the 6th and the first half of the 5th centuries BC, is situated at the point of transition from late Archaic to Classical art and so registers the developments triggered by this shift, especially in the field of choral lyric. That is, while the poetry is still heavily dependent on religious and other social occasions for its delivery, it also gradually ceases to preoccupy itself mainly with religious themes, and adopts wider political, moral, intellectual, and literary concerns.

No poem of Simonides survives in its entirety. But the extant fragments indicate that he was an expert in a wide range of lyric expression. We have evidence that he composed epinicians, dithyrambs, dirges, paeans, encomia, partheneia, elegies, and epigrams. His elegies included traditional sympotic pieces as well as some historical ones, such as the elegy on the Battle of Artemisium and the one on Plataea, a portion of which turned up in a papyrus published in 1992 (*Oxyrhynchus Papyri*, 3965).

Simonides was a professional poet with great scope and range. Ancient critics praised his elegant lyricism and his colourful and decorative diction, but they also admired his balanced discourse and the smoothness of his composition. The typical noble features of Archaic lyric are juxtaposed in his work with new ethical preoccupations, and sensuous details with gnomic austerity, just as the heroic absolutes of the aristocratic tradition are framed by a more tolerant and flexible world view that is willing to take into consideration inner conflicts and the uncertainties of fortune.

Simonides' work was an important influence on the poetic production of the two other major choral poets of the 5th century BC, Bacchylides and Pindar. And it was especially Simonides and Pindar

who persistently incorporated in their poems reflections on the significance of their craft. Simonides regularly quoted and commented on the earlier poetic tradition and is believed to have explicitly compared himself to Pindar. Aligning himself with a strand of the tradition that goes back to Homer and Hesiod and looks forward to Plato and further down to the Hellenistic poets, he also stresses the alluring enchantment, and even falsehood, of song.

The complex relation of Simonides' art to both the preceding and the subsequent poetic tradition is best celebrated by the new fragments of *Plataea* discovered in *Oxyrhynchus Papyri*, 3965. These findings give us a proem to what seems to have been an elegy on an epic-like heroic event, which also happens to be of contemporary historical significance. A proemial hymn to Achilles suggests a parallelism between the Trojan and the Persian wars, thus striking a Panhellenic note that anticipates later historians and rhetoricians such as Herodotus, Thucydides, and Isocrates. Moreover, through this parallelism the Trojans are depicted as barbarians, thus foreshadowing their tragic counterparts in 5th-century Athens. And the connections are not yet exhausted: the new Simonides fragments combine features of Pindaric encomium, Homeric diction and narrative technique, and heroic historiography, all laced with elements of the epitaph and organized by a performer with a remarkably developed persona who dominates the short elegiac poem in a strikingly un-epic way. It is little wonder indeed that critics have detected in Simonides' work a primitive model of the famous Hellenistic features of miniaturization and crossing of genres.

Throughout his long life Simonides was commissioned to work in the courts of many tyrants. He also lived and worked in the cities of the new 5th-century BC democracy. He was notorious for demanding high fees: ancient sources describe him as a money-grubber and Pindar scornfully calls his muse "Muse for hire" (*Isthmian*, 2. 6). However, this mercenary attitude also indicates an emerging professionalism. The poet ceases to be the inspired mouthpiece of the Muses or other divinities and poetic creation is no longer or not mainly their inspired gift: it is rather the combined outcome of skill and practice for which the poet deserves remuneration. Simonides may have been frowned upon for his attitude to money, but his legendary high fees, together with his less solemn tone and a certain deviousness scattered in his poems, make him an important precursor of the secularized art of the sophists of the Classical period.

Biography

Born at Iulis on Geos c.557/56 BC, Simonides may have been employed at the court of Hipparchus. Only fragments of his poems survive but he wrote on a wide range of lyric themes. He was the uncle of Bacchylides. He died at the court of Hieron and was buried at Acragas.

Sinope

City on the north coast of Asia Minor

Sinope is the most northerly point on the Pontic coast of Asia Minor, lying west of the river Halys. On a coast which afforded little shelter, it was praised from at least the time of Strabo for its harbour, a double bay divided by an isthmus on which the city itself stood. In later periods storm-driven travellers were grateful for its haven. These included the Trapezuntine *archon* (governor) of the Crimea in the 13th century, the great Arab traveller Ibn Battuta and bishop Ignatius of Smolensk in the 14th century, Vincenzo Alessandri, the Venetian ambassador to Persia, in the 16th century, and the patriarch of Antioch, Makarios, in the 17th century. From antiquity to early modern times, links with the Chersonese (Crimea) were important, as well as coasting traffic in indigenous products such as timber, iron, and the arsenical compound *miltos* (Sinop red, cinnabar, realgar) for dyeing, while its fish, especially tunny and mullet, were celebrated.

Sinope has traditionally been seen with Trebizond as a colony of Miletus established in the 7th century BC. In recent times an 8th-century date has been proposed and Corinth is credited with its foundation. Perhaps there was a refoundation after the Cimmerian incursion of the early 7th century. From the 6th century connections with Athens were strong, especially after the visit of Pericles about 436/35 which saw the establishment of 600 Athenian settlers at Sinope. Herodotus remarked on its position on the trans-Anatolian route to Cilicia. The coins of Sinope, which circulated widely in the Pontus, typically have the head of the nymph Sinope and an eagle and

dolphin. Diogenes the Cynic was a native of Sinope, where his father was a moneyer. Trade with Colchis flourished, as roof tiles and amphorae from Sinope found there show. Sinope provided the ships and supplies for the return voyage of Xenophon and the survivors of his 10,000. After a period under Persian overlordship in the 4th century, Sinope became part of the kingdom of Pontus in 183 BC. King Mithridates V was murdered at Sinope but his son and successor Mithridates VI Eupator (120–63 BC) embellished its buildings and restored its walls. Sinope fell to the Romans under Lucullus and Pompey (the former displayed sculptures looted from Sinope in his garden) and in 45 Julius Caesar renamed the city, which became Colonia Iulia Felix. Under Trajan, Pliny the Younger surveyed the area and built an aqueduct.

In legend St Andrew evangelized Sinope, but in fact the cult of St Phocas, reputedly its first bishop, eclipsed that of the apostle. The 2nd-century heresiarch Marcion was a shipbuilder in Sinope before, it is alleged, his father (who was a bishop) excommunicated him for immorality. East of Sinope at Çiftlik a large basilica with a fine mosaic in a 4th-century style has recently been discovered.

Skopje

City in Macedonia

The city of Skopje lies along the Vardar river in mountainous country on the north–south route between Thessalonica and Belgrade at a distance of 320 km from Belgrade. The valley near Skopje is flanked by the Sar Planina mountain range, which extends into Thessaly east of Trikkala. In the Roman period the town was called Scupi, an outpost town, which would eventually become the capital of the district of Dardania in the 4th century AD. In AD 518 two events occurred that altered the town’s location and name: barbarians sacked it and a disastrous earthquake struck. The town was rebuilt on the

Vardar river and given its Slav name of Skopje, which is said to be derived from the Greek word for “episcopal”.

Linguists have traced the influence of Greek over three millennia. As early as 900 BC the area was known to be Greek-speaking. The word “Macedonian” can be traced to the Greek “Makedones”, high (tall people) or highlanders. The debate is particularly focused on what language(s) inhabitants of the Skopje area spoke. The Macedonian alphabet, primarily Cyrillic, was established as a language in May 1945, and the first primer appeared in 1946 from the University of Skopje. Others debate the extent to which Macedonian is a dialect of Greek. Since the early 19th century, linguists (H. Ahrens, O. Hoffman, G. Buck, J. Chadwick, and G. Babinoitis) have considered the Macedonian language a form of pre-stage Greek, or a dialect related to northwestern ancient Greek.

Artefacts collected from the Skopje area provide evidence of Hellenic cultural continuity. Archaeological finds housed at the museum in Skopje date from the Neolithic period with artefacts such as the “Great Mother”. Habitation continued through the Iron Age (1050–650 BC). The Skopje Museum’s collection of substantial Hellenistic artefacts, as exemplified by figures such as *Dionysius the Laurel Bearer*, from the 1st century BC, attests to Greek cultural influences. Recent archaeological excavations have revealed more than 5000 inscriptions in Greek on grave stelae and votive offerings. Coinage and sanctuaries dedicated to the 12 Olympian gods supply evidence of Greek influence in Skopjan Macedonia, even when allowing for cultural distinctions.

Historical documents confirm the Hellenicity of the Skopje area and Macedonia. Thucydides (2. 99) wrote that the Macedonian state was founded in the 7th century BC. The historian Polybius documented flourishing Greek culture between 280 and 160 BC. He recognized the importance of Macedonian cooperation with the Greeks: “The Greeks would be for ever the greatest danger, if we did not have as a bulwark the Macedonians and the ambition of their kings.”

The inhabitants of the area, as Macedonians, have claimed ancestral links in turn with Illyrians, Dorians, Thracians, Dar-danes, and Paenones. The ancient royal house is traditionally said to be derived from Argive origins when descendants of Temenus and Heracles migrated and ruled as a Macedonian dynasty up to the 4th century BC (Thucydides, 2. 99). Herodotus (5. 22) affirmed that the Macedonian tribes were of Greek descent: “And the people originating from Perdiccas are Greeks”. Some question the Hellenicity of Macedonia because Demosthenes labelled Philip a barbarian. From this antique name-calling, it was presumed that Macedonians were non-Hellenes. This presumption does not take into consideration the fact that the

word could refer merely to an uncultivated person. Plutarch (*Life of Aratus*) called the Macedonians *allophyloi* (foreigners); but Alexander the Great's ardent support and exportation of Hellenism during his reign is evident.

Slavery

Slavery was apparently known already in Mycenaean times, but it is not quite clear to what extent the Mycenaean *doero* meant the same condition as the Greek word *doulos*. Various kinds of unfree people are also to be found in Homer: prisoners of war, women as booty of war, domestics, and servants in agriculture. The origins of slavery lay probably in war and/or indebtedness; the occurrence of the latter greatly increased after about 600 BC, when money was introduced and trade and business expanded. A real slave trade seems to have been established first in eastern Greece and the areas bordering on northern

and eastern barbarian countries; from there it quickly spread to commercial centres such as Athens, Corinth, and Aegina. From the 5th century BC onwards, slavery was an established social institution in Greece, and the laws of this institution were (with minor local variants) more or less the same everywhere. A slave was the property of his master and could be sold and bought like cattle; the price (between a half and ten *minae*) depended on his skills and his physical condition. Slaves toiling in workshops, at public buildings, in mines, etc. received the same salary as free workers and could eventually buy their freedom. They had no political rights, but were in some measure protected by the law; they were allowed to marry and have their own money. In Athens a stranger was not allowed to mistreat or beat a slave who was not his property. Slaves often retained the cults of their native countries; in Athens they were even allowed to take part in the mystery cults.

In Classical Greece slaves were mostly “barbarians”, including many from Asia Minor, but also Thracians and Scythians; trading places in the Black Sea and cities such as Byzantium and Ephesus were big suppliers of slaves for Greece. Grave stelae, lists of slaves in the Athenian fleet, lists of the workers on the Athenian Acropolis, and inscriptions of slaves who bought their freedom at Delphi show a wide range of countries from which slaves came: Egypt, Caria, Illyria, Lydia, Mysia, Paphlagonia, Persia, Phoenicia, Phrygia, Syria, and others. Pseudo-Aristotle’s *Oeconomica* gives the telltale advice not to have too many slaves from the same nation (ch. 4).

The circumstances that brought people into slavery are not always clear; a great number of them were certainly prisoners of war; armies must have been one of the most important sources of supply in Greece (during his invasion of Scythia in 339 BC Philip II of Macedon enslaved and sold 20,000 women and children). Slave traders apparently accompanied armies on their campaigns and instantly bought prisoners as well as other booty. Sometimes barbarian tribes even seem to have exchanged their own people against urgently needed goods; the sentence “You are a noble Thracian, sold for salt” (Menander, fr. 891 Kassel-Austin) was proverbial in Greece. Another source was piracy, which reached a peak in the middle of the 4th century BC (in 334/33 BC the general Diotimus was honoured in Athens for his fight against pirates). The Attic slave trade was centred in Athens and Sunium, the harbour of which played an important role in the import of goods since the beginning of the 5th century BC; from there the slaves could be brought directly into the silver mines of Laurium.

In the ancient world a slave could work in every kind of profession, not just as “mean slave labour”; there were slave doctors, stonemasons

at official buildings, soldiers, entrepreneurs, wetnurses, teachers, musicians, artisans (potters and painters), etc. Household slaves made up the majority of the slave population in Greece; considerable numbers were also employed in agriculture. In Athens minor public positions (the police among them) were filled by slaves; these so-called “state slaves” had a salary and their own dwelling. Astonishingly, the police in Athens consisted of Scythians, who were famous for their skills as archers; several times Aristophanes makes fun of them as stupid, stammering, and randy barbarians. State slaves able to write and calculate were also used in the army; if they were killed in action, they were given a state funeral like free citizens, and the survivors were often set free. The many slaves working in the silver mines were an important factor for the Athenian economy; often they were not the property of the state (who owned the mines), but were hired in groups from private masters (the Athenian general and politician Nicias cleverly employed such slave groups to further his own income). Some of these people must have been highly specialized to do the more difficult work (probably they had already been imported as skilled workers from countries such as Thrace and Paphlagonia which were also renowned for their mines), and they at least had a chance of rising to the post of an overseer; for the great majority, however, working in the mines was by far the worst, most horrible, and most humiliating fate (in this manner the Athenian army captured in Sicily in 413 perished in the quarries of Syracuse). Still, several grave stelae and votives (mostly for gods of Asia Minor and Thrace) found in Laurium show that it must have been possible even for these people to preserve something of their own life and their native cults.

Serving as nurses and pedagogues was another important “profession” of ancient slaves; in Classical Athens Thracian wetnurses seem to have been very popular. From the middle of the 4th century BC on, numerous grave stelae and grave epigrams were dedicated for nurses by their foster children and their families, often containing the same laudatory epithets as for their next of kin. It is remarkable that the Greeks entrusted their children to barbarian slaves and gave them duties with so much responsibility.

It is still an unsolved question how many slaves lived in Classical Attica (assessments range from one quarter to half of the whole population), to say nothing about other regions; it is also disputed how many slaves lived in an average Greek household, as ancient evidence on this question is almost completely lacking. Still, some remarks in comedies of Aristophanes seem to show that a “normal” citizen had at least one slave; even the poor farmer Chremylus has one (*Plutus*, 253ff.), as do the birds (*Aves*, 70, 1579f.), and to have none

means utmost poverty for Praxagora (*Ecclesiazusae*, 593). A middle-class family may have had between three and twelve slaves, but this number certainly varied according to place and epoch. In the later 5th century BC there must have been a considerable number of slaves in the silver mines of Laurium, for according to Thucydides (7. 27. 5) 20,000 of them went over to the enemy after the Spartans occupied Deceleia in 413 BC. Compared with other Greek states, Classical Athens (with its leading role in the Delian league) may have had the largest proportion of slaves in relation to its citizens; in any case they always held an important place in the economy.

From the later 5th century onwards, Greek thinkers developed something like a theoretical concept of slavery. Its institution was usually justified by the notion that barbarians were slaves by nature because they had no political institutions for free and equal citizens and because the monarchies in which they often lived were themselves a kind of slavery; therefore, as Euripides put it (*Iphigeneia at Aulis*, 1400f.), “it is right that Greeks rule over barbarians”. The thesis of barbarian inferiority and a legitimate Greek claim of dominion over them is also found in Aristotle (who reportedly advised Alexander the Great to treat barbarians like animals and plants), Isocrates, and Plato, who outlined precise laws of slavery in his *Laws*. These sources, of course, primarily reflect political tendencies after the Persian Wars and do not necessarily tell us how slaves were perceived or treated in reality; many grave stelae with touchingly personal inscriptions were set up for loyal slaves and faithful nurses by their masters and show that their relationships were more complex in the real world than in philosophical theory. The Sophists and later the Stoics and Cynics declared that all people were equal and free by nature, and noble slaves can also be found in the plays of Euripides; even the slaves themselves, however, apparently did not question the institution of slavery and had no “class-consciousness” of their own.

In Hellenistic times new areas of trade and new markets (e.g. Delos) led to an increase of slavery; the legislation concerning slavery saw new developments (taxation of slave trade, intensified search for runaway slaves, but also extended asylum rights). Menander's comedies show that there was often a very familiar relationship between master and slave.

During the Roman empire mass enslavement of free people (as a consequence of wars and conquests) increased; but slave revolts (among other places in Attic mines and on Delos) remained unsuccessful. Many Greek slaves (and freedmen) worked in the imperial household and held important administrative posts. The sources (among others Libanius, Justinian's law corpus, Egyptian papyri, the letters of Sidonius Apollinaris) show that slavery was still

an important factor in the economy of the late Roman empire; in Byzantine law, slaves still had almost no civil rights, but at least the intentional killing of a slave was now treated as homicide.

The Church's attitude to slavery was ambiguous: while some (e.g. Gregory of Nazianzus) condemned it, others (e.g. Basil the Great) tolerated it as a necessary evil. The Church (following St Paul) usually pointed out that slaves and free men alike were servants of Christ, so that worldly freedom was irrelevant; nevertheless, Christian masters were advised to treat their slaves as brothers.

Smyrna

City in western Asia Minor

The first ancient Greek settlement of Smyrna was founded in about the 10th century BC on the northeastern shores of the gulf of Smyrna, in what is now the modern Izmir suburb of Bayrakli. Aeolian Greek migrants established their colony here on the site of an earlier Anatolian settlement, but were soon themselves displaced by Ionian Greeks. From this time on Smyrna was considered part of Ionia, though it was not incorporated into the Panionium, or organization of the original 12 Ionian colonies, until the 3rd century BC, following the refoundation of the city. Fortified by at least the 9th century BC, Old Smyrna boasted a fine archaic temple of Athena. It was most famous, however, for its claim, strongly contested by neighbouring Chios, to be the birthplace of Homer. Indeed, still today, Classical scholars generally agree that the Homeric poems underwent their early development in the Smyrna-Chios region: the mixed Ionic-Aeolic dialect of the poems belies their origin in this part of the Greek world, as does also their description of the topography of the Smyrna region. The ancient tradition linking Homer and Smyrna proved to be long-lived and widespread across the Hellenic world: Aristotle, Pindar, Aristides, and Dio Chrysostom, among others, all mention Homer's Smyrnaean roots. By the 2nd century BC coins of Smyrna could be identified by their pictorial device of the seated figure of Homer, shown together with his name. At the turn of the 1st century BC–1st century AD Strabo also details the existence of a Home-reion, or shrine to Homer, in the refounded city of Smyrna.

The first Greek city of Smyrna at Bayrakli grew and prospered until c.600 BC, when it suffered destruction at the hands of the powerful Lydians. It was never to recover from these destructions, and declined further throughout the Classical period, until by the late 4th century BC it lay more or less abandoned. At this time the second Greek city of Smyrna was founded on the slopes of Mount Pagus, on the opposite

(southeastern) shores of the Smyrnaic gulf. The refoundation of the city can perhaps be attributed to Alexander the Great, or alternatively to Anti-gonus I and Lysimachus. It is this site, gradually and considerably enlarged over the centuries, which has remained in continuous urban use until the present day. Fortified from the beginning, the new city soon prospered and, during the Hellenistic period, attracted the interest of both the Seleucids and the Attalids, to whom it reacted with vacillating loyalty. The increasing power of Rome further served to increase Smyrna's prosperity and prestige as it emerged as one of the major cities of the Roman province of Asia, well placed on routes of trade and communication and functioning as a Roman administrative centre. As such it was graced with many fine public buildings, and Strabo claims it to be the most beautiful Roman city of his day. In AD 178, however, disaster struck in the form of a powerful earthquake, which resulted in grave damage to the city and necessitated much rebuilding. The imperial favour and generous benefactions of Marcus Aurelius, nevertheless, made this reconstruction work possible, the extant remains of the state agora still today bearing testimony to the suitably grand scale on which the refurbishments were carried out. By the mid-1st century AD Christianity seems already to have been established at Smyrna. From this point onwards, the city played a significant role in the development of the early Christian Church, a role perhaps recognized in the book of Revelation by the identification of Smyrna as one of the seven Churches of Asia. As elsewhere, the early Christian Church at Smyrna was subjected to much persecution, and in AD 155 Polycarp, bishop of Smyrna, was martyred.

Socrates 470–399^{BC}

Philosopher

Socrates was born in Athens, the son of a stonemason and a midwife; he was executed by the Athenian democracy in 399^{BC}. He did not leave any written work; and yet Karl Marx rightly called him the embodiment of philosophy (*Rheinische Zeitung*, no. 179, 1842; Karl Marx–Friedrich Engels, *Werke*, vol. 1, Berlin, 1956, p. 91). For Socrates lived his entire life for philosophy. He learned his father's craft, but the political service of his polis and the education of his fellow-citizens were more important for him. Such a way of life was possible, for everyday life was simple and thus not expensive. He strove to be a good citizen and served his native city several times as a brave and persevering soldier, but he refused to act wrongly when ordered to do so by the authorities of the pseudo-democracy. He considered that his first duty was to seek the truth and he tried to show it by the maieutic method of his mother, the midwife. He made enemies by questioning the knowledge and opinions of his fellow-citizens in chance meetings. But he himself confessed that he knew nothing. Wishing to be taught, he became an ideal teacher; rejecting the sexual pederasty that was common in Classical Greece, he developed the pedagogical ethos. He was familiar with the doctrines and writings of the natural philosophers, especially of Anaxagoras, but their answers did not satisfy him. More important for him was the individual and social morality that was directed by the demonic, which was more powerful than the human conscience: it was a divine voice. Socrates was a deeply religious man. He made use of the sophistic dialectics, not for his personal advantage, but in the search for truth. He was not interested in establishing a philosophical system or in laboriously propagating them by writing. Already in his lifetime there were thus very different views about his personality and his doctrines. He was known as an odd man, and became an object of mockery and caricature (for instance in the comedies of Aristophanes), and, as we have seen, he made enemies for various reasons. He was thus subjected to a political trial, charged with impiety and corrupting young men, and was condemned to death by the Athenian radical democracy.

According to the customs of his time Socrates' wife and sons were in the background of his life. This was the cause of many anecdotes about the character of his wife Xanthippe and his relations with her. Indeed, his relationships with his friends and pupils were particularly important for him. Socrates, the man without riches or power, attracted a circle of aristocratic young men which occasionally attracted criticism from some democrats. Members of this circle

included the two authors whose writings about Socrates survive: Xenophon and Plato. Xenophon was a competent officer, a successful farmer, and a good chronicler, but he was more a man of action than of theory. What he reports in his *Memorabilia* is very valuable, but it represents only part of Socrates' philosophical speculations. For Plato the figure of Socrates was a pretext to formulate his own opinions, and it is difficult to fix the boundary between Socratic inheritance and Plato's continuation. It should be noted that neither Xenophon nor Plato mention each other.

Socrates did not participate in Athenian politics, but some of his pupils were celebrated as the founders of various philosophical schools, such as Plato of the Academy, Aristippus of the school of Cyrene, Phaedo of the school of Elis, and Antisthenes of the school of the Cynics. The Hellenistic doxographers did not reflect the doctrines of Socrates, but preserved a tradition of anecdotes and apophthegms, of which we find traces in the writings of Diogenes Laertius of the 3rd century AD.

In the Roman period a new and different interest in Socrates awoke. A collection of fictitious letters of Socrates appeared (edited by L. Koehler, Berlin 1928). Plutarch, the popular philosopher, priest at Delphi, and archon at Chaeronea, wrote *On the Divine Socrates* and *On the Condemnation of Socrates* and produced an *Apology for Socrates*. A friend of Plutarch, Favorinus of Arelate (2nd century AD), rhetorician and polymath, wrote a (lost) book *On Socrates and His Erotic Art*, which drew the criticism of the contemporary physician and philosopher Galen of Pergamum. The archaizing orators Dio Chrysostom and Maximus of Tyre treated Socratic problems in their speeches, such as the demonic or the erotic, and influenced their colleagues. The Neoplatonists celebrated the birthdays of Socrates and Plato with sacrifices, solemn dinners, and speeches.

At Rome the life and work of Socrates were read more in Xenophon than in Plato. The most important mediator was Panaetius (c.185–109 BC), the director of the Middle Stoa. Cicero called Socrates the father of philosophy and praised him for bringing philosophy down from heaven to everyday life (*Academica Posteriora*, 1. 415). The philosopher Seneca the Younger (1st century AD), when speaking of Socrates, utters only commonplaces. Valerius Maximus (early 1st century AD) in his *Factorum et Dictorum Memorabilia* sometimes mentions Socrates as a praiseworthy example of virtue and wisdom with sound character and self-control.

For the Christian Apologists, and especially for Justin (c. AD 100–c.165), Socrates was a forerunner of Christ; for Socrates the *logos* (intellect) was necessary, while Christ is in possession of the *Logos* (governing principle of the universe). The Alexandrian theologians

held this view, but it was rejected by western Christian writers; for St Augustine all the virtues of the pagans were no more than splendid vices.

Biography

Born at Athens in 470 BC the son of a stonemason and a midwife, Socrates served as a soldier in several battles. He was married to Xanthippe and had two sons. He played little part in public life and devoted himself entirely to philosophical debate. He wrote nothing, but his pupils included the founders of several philosophical schools, including Plato. When ordered to arrest an innocent man he refused to comply. He was charged with impiety and with corrupting young men and condemned to death in 399.

Solon c.640–c.560_{BC}

Poet, statesman, and philosopher

Solon lived and worked in Athens in the late 7th/early 6th century BC. His poetry survives only in fragments. The biographical tradition is

late and not completely reliable, but one may draw a general picture of Solon's life and activity. He was an aristocrat, and became active in Athenian politics probably at an early age.

Solon's entry on to the political stage appears to have occurred in the following way. Athens and its neighbour to the west, Megara, had been fighting for some time over the possession of the island of Salamis, which lies between the two cities in the Saronic gulf. When Solon was a young man, the island was in the possession of Megara and the Athenians had passed a law forbidding discussion of reopening the war for possession. If the sources can be believed, Solon rushed into the marketplace feigning madness and recited a long poem about the recovery of the island (frr. 1–3). The war was resumed and ultimately Athens regained possession. The story reveals something about the way people perceived Solon's character: fiercely Athenian, he was full of bravado, and very clever. He was a good enough poet and speaker to persuade his audience, and he made his appeal directly to the people rather than going through official channels. All these traits seem characteristic of Solon, even though the story is probably apocryphal.

Having acquired a reputation for wisdom, Solon was given the task of reconciling two opposing forces in Athenian politics: the tyrannical rulers, and the people who were on the verge of revolt. To accomplish this task, Solon composed a set of laws which effectively ushered in democratic ideals (frr. 4a–c). Among his reforms were the *seisachtheia*, or shaking off of debts, the introduction of a representative council of 400 Athenian citizens, the abolition of debt slavery, a grant of amnesty for all those who had left Athens on account of excessive debt, and other measures (see *Athenaion Politeia*, 5–12). These laws were apparently meant to replace the stern measures contained in the code of Draco, the earlier and harsher legislator of Athens. After putting the reforms into place, Solon was said to have left Athens for ten years.

Although Solon clearly opened a door to representative government for the people, the reforms were not entirely effective and ultimately Athens slipped back into a modified tyranny which it would not escape until the late 6th century BC. In spite of this, Solon's name became linked with democracy and remains so to this day. The Attic orators of the 4th century BC (Demosthenes and others) commonly invoked Solon as the founder of democracy, and the mid-4th-century BC text referred to as the *Constitution of the Athenians* (*Athenaion Politeia*) attributes virtually all democratic reform to either Solon or Cleisthenes. Solon was a reform-minded conservative who tried to address the concerns of the people while at the same time maintaining a firm power base for the aristocracy.

So little of Solon's poetry has survived (about 300 lines out of a total output of well over 5000) that it is difficult to draw many firm conclusions about it. His poetry treats various themes, including politics (fr. 4), the dangers of excessive wealth (fr. 13), the notion that there are seven ages to a man's life (fr. 27), and even food (fr. 38–40). He is the first Athenian poet, indeed the first firmly established figure in Athenian history, although he did not write in the Athenian dialect. This poet of Archaic Athens wrote on a variety of topics central to the life of the individual and the polis. In doing so, he foreshadowed the flowering of the Classical period.

Many of the themes which Solon addressed became standard in later literature, particularly in Athenian tragedy. Specifically, fr. 13 contains, among other themes, the notions that one must guard against excess and that one must take care not to offend the gods by obtaining wealth unjustly lest they exact vengeance. This paradigm, excessive wealth (*koros*), leading to an act of overweening pride (*hybris*), which brings on justice (*dike*) and ultimately divine retribution (*ate*), is at the core of much Greek tragedy of the 5th century BC. Solon clearly saw Zeus as the driving force of the paradigm. He is not only the principal deity, but a guide to correct action. One can easily imagine that the early 5th-century BC tragedian Aeschylus had read Solon's poetry. In another poem (fr. 5) Solon spoke of the need to find the middle way, much as Aeschylus did in the final play of the Oresteia, *Eumenides*.

The wisdom for which Solon's poetry and political acumen made him famous is epitomized in his meeting with the Lydian king Croesus (Herodotus, 1. 29–33). After showing Solon his vast wealth, Croesus asked Solon who he believed was the happiest man. Solon replied that Tellus the Athenian was happiest because he had a good family and had died defending his country. Croesus asked who would be second, and Solon chose Cleobis and Biton. These two Argive heroes had yoked themselves to an oxcart and pulled their mother, a priestess, to a festival of Hera. On entering the temple of Hera, the mother prayed that her sons should receive the greatest gift the gods could give. She emerged to find the two lying on the temple steps, dead. Solon then told Croesus to count no man happy until he has passed the limit of his life, i.e. one cannot judge that a man's life has been happy until he has lived all of it. The story and its attendant proverb, often misinterpreted as though the Greeks thought death a good thing, demonstrate the insight for which Solon was famous.

Although Solon's poetry has received some scholarly attention, discussion of it generally focuses not on its technical innovation but on the thoughts that it contains. Through the ages Solon has been cited principally as a statesman, a wise legislator, and one of the seven

sages. His most important legacy has been the ideals of democracy.

Song

The corpus of Hellenic song includes a broad range of repertories for

amateurs and professionals that reflect the ubiquity of singing in Greek society from antiquity to the present day. This diversity reflects not only processes of stylistic development, but also the varied ways in which vocal music has served to punctuate nearly every aspect of public and private life. The study of repertories antedating the 19th century, however, is limited by the historical tendency of Greek singers to rely heavily on oral methods of transmission. Despite the existence of ancient Greek musical notation, for example, we possess only an unrepresentative handful of melodies from antiquity. One consequence of these losses is that songs originally viewed as a union of verse, melody, and, in the case of choral lyric, dance are today primarily viewed from a literary perspective. Yet even if the pitches for ancient songs are lost, their rhythm may be partially recovered from the study of their quantitative metres, elements of which have been shown to survive in modern Greek folk music.

The written history of Greek song begins with the *Iliad* and the *Odyssey*, two relics of oral traditions of sung epic which mention the performance of such forms of vocal music as paeans, laments, and wedding songs. While certain repertories continued to be transmitted entirely through oral means, the texts of others gradually became subject to literary transmission. The inclusion of singing competitions in the festivals sponsored by Greek cities – e.g. the funeral games held in Chalcis around 700, at which Hesiod won a prize for song – was evidently a major stimulant to the development of cultivated forms of song, as was cultural interchange between the Aegean and the mainland. An important link between the latter was Terpander (700–650 BC), who left his native Lesbos to embark on a career as a prize-winning poet and *kithara* (lyre) player that has earned him general recognition as the father of lyric poetry. Such cultural interchange, however, did not prevent the emergence of distinct regional schools of composition during the 7th century BC. Lesbos gave birth to the Aeolian lyric of Sappho and Alcaeus, both of whom wrote solo songs of modest scale intended for private or semi-private performance. On the mainland the remarkable mix of religious and state ceremonial with competition and mass entertainment featured at such festivals as the Carneia in Sparta and the Pythian games in Delphi promoted the growth of increasingly complex forms of solo and choral lyric, most of which were accompanied on either the *kithara* or the *aulos*. Particularly significant was the emergence in Corinth around the year 600 BC of the dithyramb, a choral dance to Dionysus with *aulos* accompaniment that later played a seminal role in the development of tragedy.

Over the course of the 6th century BC poet-musicians received increasing levels of state support, particularly from dictators seeking

to heighten the prestige of their city states. Athens, for example, witnessed the enlargement of the Panathenaia and Dionysia festivals, followed later by the Pisistratids' sponsorship of such composers as Lasus, Simonides, and Alcaeus. The succeeding generations of 5th-century BC Athenians, which included Pindar and the great tragedians, brought song to its apogee as an integrated art form encompassing verse, music, and dance. Soon, however, the old categories regulating the form and content of compositions began to break down under the strain of constant innovation and ever-increasing technical virtuosity. Consequently, music and poetry drifted apart not only from the civic and religious contexts that had raised them to prominence, but also from each other, relegating the poets and musicians of later antiquity to separate professional fields.

Harsh criticism of the allegedly decadent state of song began during the 5th century BC with Plato and continued throughout the Hellenistic and Roman periods. This critique was eventually adopted by the Fathers of the Christian Church, who broadened it to include funeral laments and licentious wedding songs. In place of the music of pagan society, St Basil, St John Chrysostom, and other Church Fathers offered psalms, the singing of which was initially popularized by Egyptian desert monks. The rapid development in cathedrals and urban monastic communities of melodically interesting psalmody and hymnography laid the foundations for Byzantine chant and other regional traditions of Christian liturgical song.

Sophists

“Sophist” is a general name given to a variety of (mainly rhetorical) intellectuals and virtuosos who appeared in Athens in the mid- to late-5th century BC. It was a term of opprobrium that, while recognizing that these men were all competent at what they did, carried with it many of the connotations of the American phrase “wise guy” when used by such contemporaries as Aristophanes and Plato. Most Sophists that are known about were not Athenians, but flocked there because there was a market for what they had to teach, public speaking skills that would be effective in political life and in litigation. As there is very little extant that might enlighten modern scholars, there have been many efforts to reconstruct their teachings, particularly since G.W.F Hegel’s *Lectures*. Fragments of and *testimonia* relating to the Sophists were included in Hermann Diels’s *Die Fragmente der Vorsokratiker* (1896, with many subsequent editions), which remains the standard reference in spite of long-recognized problems with the texts he published.

Among the most famous are Protagoras of Abdera (c.490– 420 BC?), Gorgias of Leontini (483–c.400 BC), Prodicus of Cos (c.470–399 BC), and Hippias of Elis (b. 433 BC?). Protagoras and Gorgias were both active in official capacities, the former as the author of the laws governing the Athenian colony at Thurii (in 443 BC) and the latter as ambassador to Athens in 427 BC. Gorgias is perhaps the best known, since some works attributed to him have survived in their entirety, e.g. the famous *Encomium to Helen*. Only a few lines of alleged quotations of Protagoras are extant. Prodicus and Hippias were polymaths, with interests extending from natural science and mathematics to rhetoric and semantics. Others often named as “Sophists” include Thrasyarchus, Antiphon of Rhamnos, and the Athenian aristocrat Critias, a prominent leader of the antidemocratic faction active in Athens in the last decade of the 5th century.

In later antiquity, particularly in the setting of the New Academy, the Sophists were admired, along with Isocrates, for their eloquence and their efforts to systematize the teaching of rhetoric. Since then, the Sophists have been consistently placed on the margins of the philosophical establishment. Their apparent challenges to traditional

values and their divergences from intellectual orthodoxy attracted the notice of later philosophers similarly situated; and so their champions tend to be the dissenters: Denis Diderot and Friedrich Nietzsche, for instance. In recent years there has been a resurgence of interest in their ideas, one doomed, perhaps, by the sparse record left to us and by the variety of ideas the Sophists expounded.

Sophocles c.496–406_{BC}

Tragedian

Sophocles was born at Colonus near Athens in about 496_{BC} and died in 406_{BC}. Living through the glorious Persian Wars, and the increasingly inglorious Peloponnesian War, he was spared the sight of Athens' final defeat at the hands of Sparta, when it had to dismantle its walls in 404_{BC}.

He was a model citizen. He acted as a treasurer in the league Athens organized against Persia. He studied dance and was said to have danced round the trophy after the battle of Salamis. He also served as a general dealing with the Samian revolt in 441. After the Sicilian defeat he was one of the *probouloi* (Committee of Ten) elected to deal with the disaster.

Like Aeschylus, Sophocles acted in his own plays. In extreme old age he is said to have been sued by a son, who claimed he was no longer capable of managing his own affairs. He read lines from the recently written *Oedipus at Colonus*, and was acquitted. After his death Sophocles became a sacred hero like Oedipus, and was worshipped as *Dexion*, roughly translatable as "he who receives", because of his association with the cult of Asclepius, which he had helped to introduce into Athens after the plague (430–426_{BC}).

In Aeschylus, god can confront god and major questions are raised about conflicting rights. Sophocles shows man confronting god and a

world he claims can never be knowable. As one fragment says (871 Radt), the fate given to us by god is as changeable as the moon; “it never can maintain one shape for two nights, ... just when it is at its fullest and most beautiful, it flows away and ebbs to nothing.” All that can be known is something transient, like the moon in one of its phases. In spite of this, man struggles nobly. Truth, loyalty, and commitment to one’s chosen path, all characterize the Sophoclean hero and condemn him or her to isolation. But often in his isolation he redeems society. For the Sophoclean hero, the love of the impossible proves to be a redemptive love.

Sophocles is said never to have taken third place when he competed. He wrote about 123 plays, more than the other two playwrights, and is said to have won 24 times (18 at the City Dionysia). Aristotle tells us he added one actor to the two that existed; this created additional possibilities for interchange and conflict. Aristotle tells us he increased the chorus from 12 to 15. He also used scene painting to enhance the visual background. He abandoned the practice of the connected trilogy, allowing him to highlight a major character, in contrast to Aeschylus’ practice which allowed the development of a concept such as the workings of divine justice over several generations.

Of the plays that survive, only the *Philoctetes* and the *Oedipus at Colonus* can be dated with certainty, and the *Antigone* approximately, with reference to the Samian war. The following chronology is tentatively suggested: *Antigone* 443 or 441 BC; *Ajax* c.442 BC; *Trachiniae* c.432 BC; *Oedipus Tyrannus* c.427 BC; *Electra* c.413 BC; *Philoctetes* 409 BC; *Oedipus at Colonus* 401 BC (posthumous). There are many fragments, including a large part of the satyr play, the *Ichneutae*.

Antigone, *Oedipus Tyrannus*, and *Oedipus at Colonus* are often called “the Theban Cycle”, but do not make up a trilogy, performed on one day. Instead they span Sophocles’ life, and seem to reflect his own developing values. The *Antigone* shows a type of idealism which implies a belief in higher values to the point of sacrificing one’s life to achieve them; Antigone opposes civic authority. G.W.F. Hegel said the *Antigone* was “one of the most sublime and in every respect the most consummate work of art human effort ever produced”. The *Oedipus Tyrannus* seems to justify the struggle itself, as a type of self-affirmation, rather than the pursuit of an ideal. The last play shows sparks of the earlier struggle, but there is a final capitulation to death, prized as an end to suffering (*Oedipus at Colonus*, 1777–79).

Aristotle sees Sophocles as the greatest of the ancient playwrights and uses his *Oedipus Tyrannus* as a model of the way a play should be written. Sophocles is a master of character, and of the language which creates character. He steers a path between the grandeur of Aeschylus

and the witty colloquialisms of Euripides. He is also skilled at plots, and his *Oedipus Tyrannus* has been called the greatest detective story ever written. His lyrics are superb, and his characters often sing at dramatically important moments. He varies his rhythms and uses words percussively. Sophocles is also master of symbols and imagery, such as the use of blindness in *Oedipus Tyrannus*: when Oedipus can see he is blind, and when he is blind he can see. The bare island of Lemnos is also a wonderful symbol for the craggy hero Philoctetes. Sophocles has brilliant descriptions of nature, such as the ode to fair Colonus, a land of fine horses where the nightingale sings her melodious songs in the wine-dark ivy and sacred foliage (*Oedipus at Colonus*, 668–719).

The City Dionysia in 386 BC instituted a revival of the great plays of the 5th century. Around 330 BC the Athenian politician Lysurgus prescribed that copies of the texts of the plays should be deposited in the official archives, and that future performances should conform to these texts. The purpose was to safeguard the plays from adaptation and interpolation by actors and producers, of a kind to which they had already become vulnerable. These copies were lent to the Egyptian king Ptolemy I Euergetes, and will have passed into the library at Alexandria, to form the basis of the critical edition made by the librarian Aristophanes of Byzantium (c.257–180 BC). Aristophanes divided the lyrics (previously written as continuous prose) into metrical cola. He also added brief introductory comments, probably making use of Aristotle's lost *Didaskaliai* (production records). Part of these comments survive in the *hypothesis* (plot summaries) which were prefixed to the plays by later scholars in the Roman period. The composition of commentaries (*scholia*) on the plays was begun in the Hellenistic period (by scholars such as Aristarchus of Samothrace, ? 217–145 BC, and Didymus, ?80–10 BC). Further scholia were added in the Byzantine period.

The Theban plays were also popular in Rome: Accius (170– ?86 BC) wrote a *Thebais* and *Antigona* (besides *Philocteta*) and Seneca (?AD 1–65) a particularly bloody *Oedipus Tyrannus*. The selection of the seven plays that survive was probably made in the 2nd or 3rd century AD and scholia were included for school use. After parchment replaced papyrus (around the 4th century AD), the unselected plays gradually passed out of use. After the Athenian Academy was closed in 529, the Classical texts disappeared from sight for several centuries and did not re-emerge until the revival of learning in the middle Byzantine period, when they were copied from the uncial into the new cursive script. Among the scholars who wrote commentaries and handled the texts of the plays the most important are Thomas Magister (late 13th century), Manuel Moschopulus (fl.1300), and Demetrios Triklinios (early 14th

century). Triklinios brought a new metrical awareness to the amendment of the text, in particular the lyrics. Sophocles' *Oedipus Tyrannus* was one of the Byzantine triad along with *Electra* and *Ajax*. The oldest manuscript of Sophocles' plays is L (in the Laurentian library in Florence), written in the 10th century, and there are many others from the 12th to the 15th centuries. The first printed edition was published by Aldus Manutius in Venice in 1502.

Biography

Born at Colonus near Athens c.496 BC, Sophocles played his part in public life. He was a treasurer of the Delian League, a *strategos* (general) at the time of the Samian revolt, and a *proboulos* (member of the Committee of Ten) after the failure of the Sicilian expedition. He wrote more than 120 plays and won at least 20 victories, the first in 468 BC. He died in 406 BC. After his death he was revered as a hero.

Spain

Spain occupies the major part of the Iberian peninsula. Iberia is the ancient name of the country and Iberians the name of the people who inhabited the peninsula in ancient times and who became urbanized

from the 5th century BC. The first Phoenician settlement in Iberia, Gades (modern Cadiz, northwest of Gibraltar), is traditionally dated to c.1100 BC. However, archaeological finds demonstrate that this flourishing Phoenician trading settlement was not established until the 8th century BC. It minted coins down to the 1st century BC and initially traded for metals with Tartessus, a cultural agglomeration in southern Spain. Tartessus developed out of local roots, and from c.750 BC was exploiting the rich metal resources in the hinterland of Onoba (Huelva). These were traded with Phoenician settlements on the coast in exchange for metal-work, jewellery, ivory, and ceramics, all of which were in turn traded within Iberia. As a result of its close links with Phoenicians and Greeks in Iberia, Tartessus developed a unique orientalizing culture (expressed in sculpture, jewellery, and architecture, for example). Tartessus collapsed in c.550 BC for reasons that are still a matter of academic dispute.

Greek presence in the Atlantic regions of Iberia is traceable from the second half of the 7th century BC, especially in the Huelva region, where it is linked to Tartessian culture; it may also be identified in the same period in the northeastern regions of Iberia. From the last third of the 6th century BC, Greek presence in Huelva diminished and remained at a low ebb for the next 100 years. The Greek colonies in Spain were established by the Phocaeans. Of the three known colonies – Emporion, Rhode, and Maenace – the first, which was indeed the major Hellenic centre in Spain, has received the most detailed archaeological study.

Emporion, northwest of modern Barcelona, was founded c.600 BC at about the same time as Massalia (modern Marseilles). Initially a small settlement was established on an island, and in c.575 BC it moved to the shore of the mainland, an area populated by local people and set amid marshes. It is clear from finds of local pottery in the Palaia polis and study of the city's necropolis that the population of Emporion included local people from its very beginnings. Emporion was also surrounded by the settlements of the local population; peaceful relations between colonists and natives were very important for ensuring the survival of the Greeks in the region. Iberian society was highly organized but not centralized. The Ullastret settlement, about 20 km from Emporion, housed the Iberian elite of the hinterland. Situated atop a hill, it controlled the whole of the territory surrounding Emporion. In consequence, the relationship between Emporion and Ullastret was not merely mercantile but political as well. It may be remarked that the city walls of Ullastret were constructed only about 500 BC, long after the final establishment of Emporion. In almost every house in Ullastret large quantities of Greek pottery were found. Greek influence is clearly discernible in the

planning of the settlement, in features such as an acropolis with its own inner walls and small temples, and a porticoed marketplace.

Tivisa is another native Iberian settlement. It overlooks the Ebro river, controlling access to the Iberian interior. It has very strong fortifications and a gateway closely modelled on Greek plans of the 4th century BC. Here more Greek pottery was found. These two settlements are evidence of the close and peaceful relationship which the Greeks enjoyed with the Iberian elite who, from well-fortified settlements, controlled the hinter-land so vital for Greek trading activity. The Emporitans could expect little benefit from the marshy territory immediately around them. In the southeast of the Iberian peninsula the most important illustrations of Graeco-Iberian relations are the local settlements of Porcuna and Castulo, as well as Huelva.

Although strongly indigenous, Tartessian/Iberian culture was more Phoenicianized than Hellenized. Further Greek influence can be traced from the 4th century BC when, with the fall of the Punic world to Rome, Iberian-Phoenician links became sparse. Ionian influence on Iberian stone sculpture is obvious. Most probably, local, very Hellenized sculpture workshops existed in Castulo and Obulco. In them it is possible that Greek and local craftsmen worked alongside each other, the former adapting their artistic skills to the tastes of the local elite, and the latter working under Greek instruction. Tomb monuments show Anatolian influence (which came via the Ionians); important in this respect are funeral stelae which carry depictions of Ionic columns. Iberian small bronze figures as well as silver gilt *phialai* (libation bowls) from Tivisa and Santiesteban show Greek influence.

Graeco-Iberian script is another aspect of the Hellenization of the Iberian elite and society at large. It uses the Ionian alphabet. The earliest inscription dates from the second quarter of the 5th century BC. The script was widespread in the Hellenistic period, especially after the 2nd century BC. It is found not only at local sites but also in Emporion, on both Greek and local pottery.

Spain first experienced a Roman presence at the very end of the 3rd century BC. In 197 BC Rome divided its possessions in Iberia (or Hispania, as it was known to the Romans) into two provinces: Hispania Citerior, the eastern coastal strip; and Hispania Ulterior, the southeast coast and the Guadalquivir valley. The conquest of the peninsula was completed by Augustus in the Cantabrian Wars (26–19 BC). Twenty-two colonies were founded under Caesar and Augustus. In the 1st century AD many provincial Roman senators came from the colony of Hispania; and several emperors – Trajan, Hadrian, and Marcus Aurelius – could boast Spanish ancestry. The barbarian invasion of 409 resulted in the rapid loss of Roman control of all the Spanish provinces. By 475 Spain was finally lost to Rome.

Sparta

City in the Peloponnese

Sparta was the controlling city of Laconia, the southeastern part of the Peloponnese, situated in an extremely fertile area well watered by the river Eurotas. There was a Mycenaean settlement in the vicinity, on the hills above the opposite bank of the river, quite substantial, but hardly comparable with the great palaces of Mycenae, Tiryns, or Pylos. It may or may not have been the residence of the Mycenaean king who is personified in Homer's *Iliad* and *Odyssey* as Menelaus, the husband of Helen and brother of Agamemnon himself.

Classical Sparta was founded by Dorian settlers who moved in during the confused period after the collapse of the Late Bronze Age political systems. They avoided the previous settlement, which was later marked by a sanctuary dedicated to Menelaus and Helen (the Menelaion) and instead occupied a series of sites on the west bank, where they founded four villages. These merged, by some totally unknown process, into a single political entity which, along with a fifth village at Amyclae a short distance to the south, became the city, though for a long time – certainly until the 5th century BC when Thucydides wrote – it remained in physical terms a cluster of villages. According to Thucydides, it is clear that in his time it was distinctly a non-monumental place, in contrast to his own and other cities of his day.

The Dorian settlers brought with them a primitive constitution, paralleled by those of other settlements, particularly in Crete, which were founded or refounded at the same time as a result of the Dorian migration. It aimed to confirm the military effectiveness of the

political body. In adolescence, young men were taken from their families and lived in communal groups, where they underwent a rigorous regime of physical and military, rather than intellectual or academic, training. The effectiveness of this was enhanced by the development of the heavy infantry armour and fighting method of the hoplite type of warrior. By the 6th century BC the Spartan army was generally recognized as the most efficient fighting force in Greece, a reputation which was confirmed by the part it played in defeating the Persian invasion. The total normal strength of the army was 5000, all full citizens of the city. Citizenship was restricted to those who underwent the training regime and served in the army, in effect the adult male population of the five constituent villages. Its function was not so much to ward off external enemies (not merely the Persians, but other Greek city states, particularly Argos) as to maintain a supremacy over Laconia and, by conquest, the district to the west, Messenia. This involved another distinctive element in the Spartan system, the allocation of landed estates away from the city itself to its citizens, who were entitled to the products of their estates, but which were farmed for them by subservient workers, the helots ("captives"), who were tied to the land. This freed the Spartan citizens from the necessity to work for their living, and allowed them instead to dedicate themselves to military training. Part of the food produced by their estates had to be given to the military group to which they belonged, and where they normally ate, rather than at home.

The reason for this system is unclear. In the training and communal meals there is a primitive, tribal element; but when it first emerges, it is devoted to a supremacy which enabled the Spartans to trade agricultural produce for luxury items imported especially from the east, a phenomenon to be found in other contemporary Greek cities, Corinth most clearly. Items such as pottery, metalware, and so forth were also produced in Laconia itself: examples have been found in the Archaic levels at the sanctuary of Artemis Orthia on the banks of the Eurotas, and at the Menelaion, along with ivories and other imports. There must therefore have existed an artisan class, though who they were and where they lived is uncertain. They are usually attributed to a third political category, the "dwellers round" or *perioikoi*, communities which enjoyed local independence (i.e. they were not tied helots), but were under political obligations, particularly of rendering military assistance, to the Spartans. Their numbers, when called upon, seem to have doubled the size of the Spartan army. However, the Spartan army was needed more and more, particularly after rebellion by the Messenian helots, to police and maintain the Spartan constitutional supremacy. It became self-devouring: military supremacy was needed to maintain the training and living systems,

which were themselves needed to maintain military supremacy. Thus it had become an end in itself. This led to a tightening of the regime, and in particular a rejection of luxury and personal wealth. Strengthening the system meant its maintenance, and innovations were frowned on: Sparta notoriously did not issue its own coins, since coinage had been invented to facilitate commercial development.

As a result, Sparta emerges as the natural antithesis of Athens: restricted constitution in contrast to democracy, military prowess as opposed to naval development, self-sufficient instead of relying on trade and imperial exploitation. It even kept its curious institution of a dual kingship, at a time when most Greek states no longer had kings. It is a contrast which, in its political application, led to war.

Sparta failed because it was not equipped to deal with the problems which faced the wider Greek world, particularly the need to maintain a constant defence against the possibility of a Persian resurgence. The consequences of this can be seen in the strains imposed on Sparta when it tried to sustain this role in the first half of the 4th century BC. The loss of Messenia, liberated by the new-style Boeotian army, crippled it permanently. This and other strains led to a steady decline in numbers of the citizen population able to draw from their estates to contribute to their military groups: the problem may have been exacerbated by a primitive system for deciding inheritances. The number of subordinate helots (except for those lost with Messenia) and *perioikoi* does not seem to have declined, and a new group, the "inferiors", grew up in Sparta itself, former citizen families who had lost the necessary property qualifications.

At first, this diminished Sparta stands outside the new order created by Philip II and the Macedonians, largely ignored because it was unimportant, though generally managing to remain independent. Land passed into the hands of an extreme few, usually through female inheritance, and Sparta was regarded as a mere has-been. All this ended with social reform introduced by King Cleomenes III. In this he confiscated all the land and redistributed it into new estates, on the pretext that he was restoring the original Spartan system. The new land-holders were, at the same time, liable to military service, and so a new and briefly powerful Spartan army was created. It failed, at the Battle of Sellasia in 222 BC against the superior Macedonian army of Antigonos Doson, and Sparta relapsed into insignificance.

However, it was an insignificance with a distinguished past. As part of the Roman empire Sparta flourished, in the form of a small but prosperous provincial city. It traded on its traditions. The training regime was partly revived, though the harshness, which included whipping the youths, became something of a spectacle, and a theatrical structure was built at the sanctuary of Artemis Orthia so

that an audience could observe. The town itself included wealthy families, some of them newly arrived, and houses with lavish mosaic floors have been excavated. A substantial theatre was built in the 1st century BC and subsequently enlarged. In the troubled times of the late empire, and for the first time, fortifications were constructed, delimiting a much-reduced area, and these maintained the place into the Middle Ages until the population was transferred to the stronghold of Mistra, away from the river in the foothills of Mount Taygetus.

Spells

The vocabulary of casting spells comprehends the terms *epoide*, literally a “singing over”, and *pharmakon*, a broad designation that straddles the notions of incantation and drug (medicine or poison, possibly enchanted) and which could be extended to describe any psychagogic force: Plato in particular assimilated the power of the spellbinding word to the power of poetry or rhetoric, both of which deprive their objects of the capacity for autonomous action (*Charmides*, 157a; *Republic*, 607d; *Meno*, 80a; cf. Gorgias, *Encomium of Helen*).

Spells were ubiquitous in ancient Hellenic society. More than 1500 incised tablets associated with spellbinding survive from antiquity as do many incised ostraka and amulets, while the *Papyri Graecae Magicae* (PGM) of Hellenistic Egypt, dating from the 3rd and 4th centuries AD but informed by long-established practice, constitute a veritable magician’s handbook. Individuals seeking supernatural aid could buy spells from professionals; Aristophanes claims that the witches of Thessaly (an area famous for witchcraft) charged a fee (*Clouds*, 749–52) and Plato suggests that such specialist services came cheap (*Republic*, 364c).

Incantations were accompanied by various practices that served to reinforce the power of the spoken word. One important supplement to the oral spell from the Classical period onward was the process of inscription – the performance of writing down the name of the victim

and that of the god or demon invoked to work the spell lent greater efficacy to the accompanying words. Inscriptions could be empowered further by the addition of the inscribed images of humans, animals, and demons and of arcane astrological symbols and mystical numbers; often the words themselves were written backwards, mixed up, or repeated. The language of spells was highly formulaic and sometimes specifically magical; “nonsense” words comprehensible only to demons could be used, such as “abracadabra”, attested for the 1st century AD, and the Ephesian *grammata* (“letters”), recited or inscribed in apotropaic rituals.

Herbs and plants, often pharmacologically active, were used in spells, as were minerals and the body parts of animals – the *PGM* record many charming recipes; and personal effects of the victim such as hair, nails, or clothing were employed synechdochically. Magic tools were used, for example the *iunx* (a bronze whirling disc), bull-roarer, and gong, while in the *Odyssey* Hermes, Circe, and Athena have magic wands (13. 429, 16. 172, 456). Voodoo dolls of wax, mud, or dough representing the victim of the spell and often inscribed with his or her name were a common feature of spellbinding. These figurines could be placed in graves, burnt, melted, or transfixed with nails (*PGM*, 1. 83–87 suggests the insertion of 13 needles) and sometimes had their hands tied behind their backs. Indeed the vocabulary of bondage, such as *katadein* (tie down) and *kate-chein* (restrain), is prevalent in spells – more than 1000 examples of ancient binding spells (*katadesmoi*) have been found, and as late as the 12th century AD Eustathios was familiar with the idea. The concept of binding the victim is important, a notion perhaps related to the bonds of fate and a demonstration of the appeal of sympathetic magic – the victim is bound to the speller’s will and rendered powerless. The frequency of curses resulted in their corollary – antidotes: *PGM* 4. 2177 offers a spell to break the power of a curse tablet; many inscriptions suggest remedies to ward off the anger of one’s enemies (for example *PGM*, 7. 940–68, 4. 831–32); others have a more general apotropaic function. Of course the notion of magic could be used as a method of saving face: failure in anything from litigation to love could be ascribed to a malignant spell.

Often spells are agonistic in context. Many Athenian *katadesmoi* relate to lawsuits and represent an attempt to silence opponents in court: an inscription on a lead tablet from the 5th century BC calls down a curse upon Aspasia and her legal helpers (*Inscriptiones Graecae*, 3. 3106), while the “binding song” (*hymnos desmios*) of Aeschylus’ Erinyes occurs in a legal context (*Eumenides*, 306ff.). Other spells relate to success in athletics, the theatre, and business, while many promise to endow the speller with a more general appeal and

success (e.g. *PGM*, 12. 397–400). Another important locus of enchantment was love, and *agogai* – rituals designed to lead the beloved to the speller’s bed – form a large part of the literature on spelling. Theocritus’ *Pharmaceutria* (3rd century BC), a portrait of an abandoned woman attempting to bewitch a former lover, echoes the sympathetic erotic magic of contemporary practice – the melting of a wax dummy, the burning of a thread from the victim’s cloak, the use of magical tools, and an incantatory refrain.

In Greek literature it is women in particular who cast spells and are skilled in the use of *pharmaka*, while bewitchment is often troped in terms of the characteristically female activity of weaving – Medea, ancient literature’s most infamous witch, weaves spells and invokes demons (Apollonius Rhodius, *Argonautica*, 4. 1635–90). Yet the spells in the *PGM* are addressed more often to male practitioners, and their use crossed the boundaries of gender and status.

Spells were not used only to harm: some of the earliest references to incantation in Greek literature occur in a medical context. In the *Odyssey* Autolycus and his sons bind Odysseus’ wound and sing incantations over the dark blood (19. 457) and Pindar’s Cheiron heals with incantations, *pharmaka*, and surgery (*Pythian*, 3. 43–54). Indeed the distinction between magic and medicine in antiquity is blurred: amulets (*periapta*, *periammata*) applied with incantations were worn as remedies for or prophylactics against disease (e.g. as a cure for headache, Plato, *Charmides*, 155e–156e); healing with spells is mentioned (and disparaged) in a text belonging to the Hippocratic corpus (*On the Sacred Disease*, 1–2); Plato says midwives use *pharmaka* and *epoidai* to induce labour (*Theaetetus*, 149c–d). The distinction between magic and religion is arbitrary too: many spells were in prayer form. Plato claims that sorcerers persuade the gods to serve them by prayers (*euchai*) and *epoidai* (*Laws*, 909b; cf. *Republic*, 364c) and Sappho’s prayer to Aphrodite has the tone of an erotic magical spell (fr. 1 L-P). Indeed the whole pantheon of Greek gods was invoked in incantations in which supernatural powers were compelled to serve the speller, although Hecate, Persephone, Selene, and Hermes figure most prominently.

In ancient Greece religion and “magic” were not mutually exclusive categories and no legislation of pagan antiquity relates directly to spells (although Plato suggested that “black magic” should be criminalized, *Laws*, 933a).

Sporades

Islands in the northwest Aegean

The Sporades comprise a cluster of four islands and a number of rock islets in the western Aegean Sea, extending in longitude from Thessaly to Euboea. The three main islands – Skiathos, Skopelos, and Alonnisos – lie southeast of the Magnesia peninsula, while Skyros is situated further south, northeast of the midpoint of the island of Euboea. Their geographical location has determined their administrative position, making Skyros part of Euboea while the other three belong to Magnesia.

Although the islands have a common history, each is known for its own character. Skiathos has a cosmopolitan ambiance; Skyros is well known for its rich local folklore; Skopelos is famous for its outstanding churches; and Alonnisos for its scenery.

Skiathos is the closest of the four to the mainland, situated opposite Mount Pelion about 43 nautical miles from the port town of Volos. It covers a surface of 48 sq km and is populated by little more than 4000 people. Endowed with a large number of lovely beaches and a pine-filled landscape, it has long been one of the most attractive tourist destinations of Greece. Of the nine small islands surrounding its coastal waters, two with the name Tsougries lie across the main harbour, making it a safe haven for small boats and yachts.

The island's strategic location was a principal reason for its being conquered by a long succession of rulers since antiquity. During prehistoric times, it was inhabited by Pelasgoi who came from Thrace in northern Greece around the 12th century BC. It is hypothesized that Cretans of the Minoic age also inhabited the island. This idea is supported by the name of the island, which is very similar to "Skianthios", the Cretan name for the god Dionysus. Thessalians of the Mycenaean age may also have been among the early settlers. Ionians and later Chalcidians colonized it by the 6th century BC. In 477 BC Skiathos became a member of the Delian League to gain protection from Persian invasion. Initially city members of the alliance were autonomous and had a democratic administration, but Skiathos came increasingly under the direct rule of Athens, until it passed into the control of Sparta following its victory in the Peloponnesian war in 404 BC. The Antalkidios peace treaty in 386 BC gave the island its official independence, but Sparta violated the agreement and Skiathos was again under their hegemony. In 378 BC the island regained its autonomy by becoming an ally of Athens and taking part in the second Athenian Alliance. During almost 40 years of this alliance, Skiathos enjoyed a remarkable economic prosperity, a sign of which was the privilege of minting its own coins. The Macedonian victory in the battle of Chaeronea in 338 BC signalled the beginning of Macedonian occupation. During the second Macedonian war in 199 BC, Philip V completely destroyed Skiathos and Skopelos so they would not fall into the hands of the enemy Roman fleet, which nevertheless reached Skiathos and completed its devastation. A quick recovery followed and the island obtained a democratic regime in 197 BC. When Greece was subjugated by Rome in 146 BC, Skiathos followed the fate of the rest of the country. In 42 BC, after the battle of Philippi, Mark Antony handed the island over to the Athenians as a token of appreciation for their assistance.

Skopelos (Greek for "steep rock from the sea" because of its rugged coastline) is almost twice as large as Skiathos and has about the same population. It is situated between Skiathos and Alonnisos and, like Skiathos, has frequent connections with Volos and Euboea. Its land is mostly flat with only a few low mountains. Pine trees abound and the

local prunes are famous. The verdant landscape, the domestic architecture, and the churches are the chief attractions of this island.

Its present name appeared first in the Hellenistic period. Previously the name Peparithos was used. Legend has it that Peparithos with his brother Staphylos, sons of Ariadne and Dionysus, landed on the island with a group of Cretans in the bay known as Staphylos to this day. Staphylos, who became the first king, was buried there in a grave which was discovered in 1927. The finds – a gold crown, funerary offerings, and weapons – are displayed in the museum of Volos. During historical times Skopelos was inhabited first by Mycenaeans between 1600 and 1100 BC and later by Chalcidians between 700 and 500 BC. As a member of the Delian League it was ruled by Athenians until 340 BC when it came under Macedonian dominance, which continued until 168 BC when Athenians took over once again. The Ghisi family owned the island during the Venetian occupation and built a castle with a magnificent view over the ruins of the ancient citadel. In 1537–38 Skopelos shared the fate of Skiathos, being sacked by Barbarossa and by the Turks under whose occupation it remained until the revolution, during which its fleet played an active part in the struggle for liberation.

Alonnisos to the east of Skopelos is an oblong island with a hilly landscape covering an area of 64 sq km and is populated by slightly more than 1500 people. It is the least developed of the Sporades and therefore the least visited. The sea surrounding the coastline is designated a marine conservation park to protect the Mediterranean seals which have chosen the coves of smaller islands near Alonnisos as a haven. An earthquake in 1965 damaged the earlier capital, Alonnisos, and most of the inhabitants abandoned it and resettled 5 km to the east near the sea. The present port capital of Patitiri is on the southeastern side, 68 nautical miles from Volos and 35 from Euboea. The same earthquake split the centre of the island into two small islets – Psathoura (the remains of ancient Alonnisos) and Psatharopoula. Both lie submerged.

Signs that Alonnisos was inhabited in prehistoric times were found at Kokkinokastro and on the islet near it. The earliest palaeolithic finds in the Aegean were discovered here: animal bones and stone tools dating from 100,000 to 33,000 BC (Middle Palaeolithic period). The island was known as Ikos in antiquity, and the names Chelidromia and Diadromia were used later. A variation of these, Liodromia, is heard even today. According to mythology Peleus, father of Achilles, spent the last years of his life in Ikos and was buried on the island. Statues, tombstones, potsherds, and wine bottles from Ikos have been preserved at Kokkinokastro. The Athenians maintained a naval base there, stimulating the interest of Philip II of Macedon to bring the

island under his rule. In 1538 Barbarossa and the Turks did not spare the island from plunderous attacks.

Alonnisos is surrounded by a host of tiny islands, the largest of which are Peristera and Lehoussa on its eastern side. On the small island of Youra to the northeast the Cyclops' cave with multicoloured stalactites and stalagmites is worth visiting.

Skyros, the largest in the group with an area of 209 sq km and a population of almost 2800, is the closest to Euboea, which is only 24 nautical miles away. Its capital, Skyros (Chorio or Chora), is close to the sea on the northeastern coast, while its port, Linaria, is located on the western side 11 km from the capital. The stark antithesis between the northern and southern parts of the island creates a natural divide connected by a narrow isthmus. Most of the population is concentrated in the northern, verdant part, since the southern, rocky side is virtually inaccessible. The island's vernacular architecture, its rich local folklore, and the diversity of its scenery give Skyros its unique character.

Archaeological finds reveal that the island has been inhabited since the neolithic period (5000 BC). Ancient legend considers its citadel to be the place where Thetis, Achilles' mother, hid her son disguised as a maiden among the daughters of king Lycomedes so that he could avoid the draft in the Greek campaign against Troy. Another legend claims this as the place where Theseus, king of Athens, met his death. Between 469 and 340 BC Athenians colonized the island and during Cimon's rule they divided the land in lots. Macedonians succeeded in taking over the island and kept it until 196 BC; the Athenians took it back and later passed it over to the Romans.

Stoicism

Stoicism was a philosophical movement that took its name from the Stoa Poikile, or Painted Porch, in the Agora at Athens, the central public place where philosophers used to meet, to lecture, and to engage in discussions. The school was founded by Zeno of Citium (335–263 BC), who came to Athens around 313 BC and studied under

the Academic Polemo and the Cynic Crates. He was succeeded as the head of the school by Cleanthes of Assos (331–232 BC), who in turn was succeeded by Chrysippus of Soli (c.280–207 BC), perhaps the greatest Stoic philosopher, Diogenes of Babylon (c.240–152 BC), and Antipater of Tarsus (2nd century BC). Zeno divided philosophy into three parts: logic, physics, and ethics. His followers took up and developed his doctrines in different directions. Zeno's student Aristo of Chios stressed ethics to the exclusion of physics and logic, whereas Herillus emphasized knowledge at the expense of moral action. Cleanthes, on the other hand, advocated a religious view of the world, and his contributions to Stoicism lay especially in the areas of theology and cosmology. It was Chrysippus more than anyone else who advanced and systematized the doctrines of the school; thus his works came to be regarded as offering the standard formulation of Stoicism. The so-called Middle Stoa attempted to make Stoic doctrine more accessible to a wider audience, and was more hospitable to ideas from other philosophical schools, particularly Plato's and Aristotle's. Panaetius from Rhodes (c.185–109 BC) changed the emphasis of the school's teaching to make it more directly relevant to the practical concerns of everyday life. Panaetius' pupil Posidonius of Apamea (c.135–50 BC) also modified the traditional doctrine of the school in some areas, but his main interest seems to have been the sciences, including geography and ethnography. Of the writings of the Stoics down to Posidonius almost nothing remains except for a hymn by Cleanthes and a few papyrus fragments. We have, though, numerous reports in later writers, some of them clearly hostile to Stoic philosophy, and many simply failing to grasp fully the Stoic doctrines. Thus reconstructing the philosophical ideas of the earlier Stoics proves to be a difficult, if not at times impossible, scholarly task.

Stoic philosophy was a major influence on political and moral thought in the Roman empire in the last century BC and the first two centuries AD. The treatises and letters of Seneca (c.4 BC–AD 65), the lectures of Epictetus (c.AD 55–135), and the meditations of the emperor Marcus Aurelius (AD 121–80) laid particular emphasis on the ethical teachings of the school. Seneca and Roman expositors of Stoic philosophy such as Cicero facilitated the transmission of diffuse accounts of Stoic ethics into the writings of the Latin Fathers, such as Lactantius, Ambrose, Augustine, and Martin of Braga, and subsequently into the medieval world. We find a kind of medieval Stoicism, represented by such scholars as Petrarch, and focused mainly on ethics. During Humanism the main sources for ancient Stoicism were all translated into Latin, and in the 15th century scholars such as Justus Lipsius made an attempt to reconstruct and to some extent revive Stoicism, presenting it as compatible with

Christian theology. Early modern thinkers of the 16th century such as Jean Pena, Tycho Brahe, Juan Luis Vives, and Guillaume du Vair already show the influence of Stoic ideas. Some of the most important philosophers of the 17th and 18th centuries such as Hobbes, Descartes, and Spinoza incorporated into their philosophy Stoic elements, just as scientists such as Newton also drew on Stoic ideas.

Although it may be true that especially in the later phases of Stoicism ethics became the vital concern, this does not mean that the other parts of philosophy, namely logic and physics, had a subordinate place in Stoic doctrine. On the contrary, the Stoics viewed philosophy as a whole and repeatedly emphasized the close interdependence of the three parts of philosophical discourse. For though the highest aim of the Stoic was to learn how to conduct himself in life, Stoic philosophers never doubted that this was to be based on a firm grasp of the truth and on an adequate understanding of the world. This is the reason why they used to compare parts of philosophy to the parts of an egg or an animal; the shell or the bones are logic, the white or the flesh are ethics, while the yolk or the soul are physics. The tripartite division of Stoic philosophy as well as the different orders that were suggested for the study of the three parts served only as the most appropriate way of expounding or learning the theorems of Stoic philosophy.

Logic, according to the Stoics, was the study of everything to do with rational discourse. It was divided into dialectic and rhetoric; dialectic included logic in the modern sense, but also grammar, semantics, philosophy of language, and epistemology. The Stoics believed that knowledge ultimately is based on sense experience. Human beings start as irrational animals with no mind at birth, and it is only because they receive repeated impressions from the outside world that give rise to concepts that their rationality grows, by the continuous formation of concepts and beliefs. They also claimed that in principle it is possible for human beings to have solid knowledge. For there are certain impressions, the so-called cognitive impressions (*kataleptikai phantasiai*), which by their nature indicate in a clear and distinct way a fact about the world. Hence they can be regarded as criteria of truth, i.e. as instruments for judging whether our opinions are true or false. Needless to say, the ancient sceptics questioned whether there are such criteria on which the whole of our knowledge may securely rest, and the Stoics, who engaged in a continuous controversy with them, tried to refine and develop their theory in order to meet their objections.

The basis of Stoic logic is a theory about significant speech, in which the Stoics distinguish between the sound uttered, that which is said or meant, the *lekton*, and the external referent. Although this

Stoic doctrine is often highly praised, because it seems to resemble recent theories of meaning and, in particular, to anticipate the modern distinction between sense and reference, there are significant differences. For instance, in Stoic logic a *lekton* does not correspond to any expression, say a noun, but only to a complete utterance. So some *lekta* may be questions or commands, whereas others are propositions that may be true or false. The Stoic logical system was concerned with the interrelations of non-simple propositions, in particular of propositions of the form of conditionals, exclusive disjunctions, and negated conjunctions. It was mainly Chrysippus who, also under the influence of Diodorus Cronus and Philo of Megara, advanced the logic of propositions to its highest point in antiquity, presumably independently of Aristotle's logic of terms. According to Chrysippus, this logic can be construed as an axiomatic system in which all arguments are reducible to five basic kinds of indemonstrable arguments (*anapodeikttoi*) whose validity does not admit of proof. The form of the first two indemonstrables, for instance, was as follows: (1) if the first, then the second; but the first; therefore the second; and (2) if the first, then the second; but not the second; therefore not the first. These two indemonstrables became known later in antiquity and in the Middle Ages as the *modus ponendo ponens* and the *modus tollendo tollens* respectively.

Stoic physics was based on the presupposition that there is one world (*kosmos*) which constitutes a single living being, and that there are only two principles from which everything is constituted; an active principle, which is named God, *Logos* (Intellect), or Nature, and a passive principle, which is understood as unqualified substance or matter. The Stoics stressed that these principles are always joined and never exist separated from one another. The active principle is present in the whole universe and gives to every part of it its character. It is therefore the ruling principle of the whole world, a ruling principle itself of the form of a rational living being that is both intelligent and intelligible. Materiality, on the other hand, is not equivalent to corporeality, but just one aspect of it, as any body is already formed. The world is a continuous object and it cannot be divided into discrete particles, as in Epicurus' physics. The Stoics confined existence to bodies, and vehemently rejected claims of earlier thinkers concerning incorporeal entities. Even God was identified with a special form of fire, which gives shape and life to the world. Following Heraclitus, the Stoics claimed that the transformations of fire, which correspond to the designing or creative activities of God, bring about the alternating phases of a cosmic cycle. For the Stoics did not maintain that the present world is ungenerated and indestructible; they rather believed that it will end in a total conflagration (*ekpyrosis*), but will then be

reconstituted again as the conflagration subsides. Only God persists through the conflagration as the fire into which everything is absorbed. As the world order again emerges from this fire, God's presence in earthly things is in the form of breath or spirit (*pneuma*), a fiery form of air. Organic and inorganic things alike owe their identity and their properties to it; its two constituents, fire and air, are blended in different proportions in different things. In the case of human beings, it is the human soul that constitutes part of the all-pervasive *pneuma*. Thus within the world order *pneuma* has two related functions: it gives internal coherence to individual bodies, and it also, because it permeates everything, makes the world as a whole a single coherent body.

In this rational world order, which is ruled by God or *Logos*, the interactions of bodies occur according to exceptionless laws; these laws constitute "fate" and are identified by the Stoics with providence. They held the view that for everything that happens there are causes such that, given these causes, nothing else could happen; for the Stoics "chance" is simply a name for undiscovered causes. That is why they claimed that all future events in principle are predictable, and that astrology and divination should be regarded as empirical disciplines. However, in this deterministic world there still is a place for what is just possible and not necessary. Chrysippus understood the possible as that which admits of being true and is not prevented from being the case. He moreover developed a complex theory of causation to explain how human action is free in a sense required if human beings are to be responsible for their actions. According to his view, fate is the set of external causes that act upon the individual and work to bring about their destined effects; but these external causes only trigger things to happen, whereas the primary cause is in the individual itself. Thus the external antecedent cause by itself does not necessitate the action. Now, although for the Stoics all people are responsible for their actions, only the wise man is free; for freedom consists of acting of one's own choice as one is providentially ordained to act for the best of the universe as a whole. Thus Stoicism is not a fatalistic philosophy of inaction, and the wise man will act in whatever way seems appropriate given the understanding he has; to decide to act in the way one is destined to act is in our own power, even if it is settled by fate how we are going to act, given the sort of person we are.

Stoic ethics presents the most demanding account of virtue in antiquity. Virtue alone is the good, while all wrong actions are equally wrong. We acquire the notion of the good as a crucial part of our reason, and this transforms our motivation in such a way as to be attracted by what we judge to be good. Virtue is sufficient for happiness, which is defined as life in accordance with nature; the

nature with which one is to live in agreement is both one's own rational constitution as a person, human nature, and the rationality of universal Nature or God. That we are meant to live in agreement with Nature is also expressed by the Stoics in talking about the common law, or a natural law, which demands that we do what is natural and refrain from doing what is against Nature. This gave rise to a theory of natural law that was taken up by the Christian Fathers, notably Augustine, and exerted considerable influence on discussions of human rights throughout modern times. For the Stoics the possible conflict between particular and universal Nature is only apparent; the virtuous man will have no preference of his own in conflict with the good of the world. Passions are the source of unhappiness, for a person in such a state, by assenting to a certain kind of false impression, has himself generated an excessive impulse to pursue or avoid something that in reality is indifferent. Passions as false judgements are thus not a feature of non-rational animals, but characterize only human beings who should be blamed for them. So there is no conflict between reason and desire in an individual soul free of passion, and apparent conflicts are explained as rapid waverings of our judgement.

Happiness does not in the least depend on the possession or absence of things only conventionally regarded as good or bad, such as health, reputation, wealth, beauty, etc.; these things are regarded as "indifferent", since they make no difference to virtue and true happiness. Now among things indifferent some things are in accordance with nature and others contrary to nature; both lack goodness, but the first should be selected on the grounds of their natural preferability, and that is why they are called "preferred indifferents". Furthermore, "proper actions" are all the actions that are natural to a mature human being. "Right actions" are a special kind of proper actions, the perfect proper actions, which are the peculiar province of the unfailingly wise or virtuous man. The difference lies in the motivation. A right action is a proper action done with the motivation only a wise man can have. A wise person realizes that the important thing is not to attain a particular preferred indifferent but to try to do so, because it is good to do it. For the Stoics there is a sharp distinction between the virtuous or wise person and everybody else, who is regarded as foolish. It is very difficult to be wise, and that is why the Stoics never claimed that they had achieved wisdom.

Strabo c.64^{BC}–c.AD 19

Geographer, philosopher, and historian

Strabo is the author of two monumental works: a universal history in 47 books, which has not survived, and his famous *Geography* in 17 books, which has. As a young man Strabo studied philosophy and was particularly drawn to Stoicism. He knew, and was apparently influenced by, the famous philosopher Posidonius. Strabo believed, with the Pythagoreans, that the universe was geocentric, and that the earth was a sphere with a single land mass surrounded by water. He travelled to Italy three times, visited Greece and Asia Minor, and lived in Egypt for about six years. This combination of travel and philosophical study resulted in a work of geography which is noteworthy for the exposition of a philosophy of geography and for its wealth of historical and mythological information.

Strabo held that the study of geography belongs to the realm of philosophy. He states in book 1 of his *Geography* that, although it is primarily useful to commanders and statesmen, geography is also invaluable for philosophers who investigate everything on land and sea. The study of geography presupposes “the man who busies himself with the investigation of the art of life, that is of happiness” (1. 1. 1). Given this purpose, Strabo’s methodology was to interlace clear and accurate descriptions of geographical features with a broad range of cultural information. He saw himself as writing in a tradition of literary, historical geography whose origins went back to Homer, and included Hecataeus and Herodotus.

The value of Strabo’s work also lies in the fact that it fills certain gaps in our knowledge of his predecessors. He opens his *Geography*

with a history of geographical writing from Homer down to his own day, providing critiques of earlier geographers such as Eratosthenes, Eudoxus, Artemidorus, and Hipparchus. The first two books thus provide us with an invaluable survey of ancient geographical practice, including, among other things, details about ancient mapmaking practices and attempts by Aristotle and Eratosthenes to measure the earth.

In the remainder of the work Strabo describes particular regions. He begins with Europe and works his way east to Asia, ending with north Africa. Within that range he discusses Spain (book 3); Gaul, Britain, and the Alps (book 4); northern Italy (book 5); southern Italy and Sicily (book 6); northern, eastern, and central Europe (book 7); Macedonia and Greece (book 8); Athens, Boeotia, and Thessaly (book 9); and Aetolia, Crete, and certain Greek islands (book 10). His coverage of Asia Minor is divided into four books: Caucasus and Armenia (book 11); Galatia, Bithynia, and Lycia (book 12); the Troad, including the island of Lesbos (book 13); and Ionia, Caria, Samos, Chios, Rhodes, and Cyprus (book 14). The remaining three books describe India and Parthia (book 15); Assyria, Babylonia, Mesopotamia, Syria, Phoenicia, Palestine, and Arabia (book 16); and finally Egypt, Ethiopia, and Libya (book 17).

The books which deal with Greece contain more mythological and historical information than any others. The section on Olympia (8. 3. 30), for example, has as much discussion of Homer as it does of geography. With regard to his reliability, there are times when it is clear that Strabo has visited the locations under consideration. He describes the coast of Attica in such a way that it seems likely that he circumnavigated it. At other times he seems to have relied largely on other sources. The passages on Boeotia are apparently taken largely from earlier writings, most notably the catalogue of the ships in book 2 of the *Iliad*. Most scholars would agree that Strabo probably never visited the interior of Attica, and perhaps that is true for the rest of mainland Greece as well.

We have no way of knowing whether Strabo's work ever fulfilled its task of aiding some ancient general or politician. We do know that the geography did not find a wide audience in antiquity. Strabo's work was apparently not known to the Romans, not even to Pliny the Elder, although the Jewish historian Josephus referred to it. His work was apparently not much used in the Byzantine and medieval periods, but the first translation of his text into Latin (1472) preceded Columbus's voyages by only 20 years. For the next 400 years Strabo's work was in the public eye. As an exemplar of idiographic, or descriptive, geography he was much admired. A prominent German geographer of the 16th century, Sebastian Munster, was referred to as the German

Strabo. His *Cosmographia Universalis* was a standard work for over a century. By the mid-19th century such universal geography had become impossible for one man to compile. The trend was toward specialization, and from that point on, Strabo was forgotten as more modern methods of geographical research evolved.

For all that, Strabo's approach to geography is remarkably modern, a suitable predecessor to the current integration of physical and cultural geography. His prose does not, perhaps, reach the heights of literary achievement, but it is serviceable and he does not claim to be writing a literary masterpiece. A. Lesky's harsh judgement (*History of Greek Literature*, London, 1966, p. 890), that Strabo is "not important in any way", is surely unmerited. The value of his work as a compendium of cultural information, a historical geography, and a philosophy of geography is inestimable.

TIMOTHY F. WINTERS

Biography

Born at Amaseia in Pontus c.64 BC, Strabo was a pupil of Aristodemus of Nysa and later studied philosophy at Rome. He knew the philosopher Posidonius from whom he may have developed the idea of writing a historical geography. He wrote two major works: a universal history in 47 books (lost) and a *Geography* in 17 books which survives. He died c.AD 19.

Superstition

Superstition, taken to refer to a mechanical application of ritual without regard for or knowledge of either the outcome or the reasons underlying the act, can be said to exist in one form or another in every culture and society. In this sense the term is derisive and negative. For that reason one would be hard pressed to find any person or group of persons who jealously claimed that they were superstitious or that their beliefs amounted to superstition. Nevertheless, the word does have a certain currency in discussions of religion and magic. Modern scholarship has yet to purge it of its purely negative connotations or to arrive at any adequate definition of it.

The Greek term for superstition is *deisidaimonia* which roughly means "fear of the divine". The adjectival form of the word, *deisidaimon*, entered the language in the early part of the 4th century BC and bears a neutral, if not positive, meaning. Thus in the *Cyropaedia* Xenophon uses it to designate the piety of Cyrus' soldiers. Writing a few decades after Xenophon, Aristotle in the *Politics* also uses the word in a positive sense, saying that a populace takes comfort in a leader who is pious.

Deisidaimonia is far more commonly used in a derogatory sense, and the ancients commonly supposed that women were especially susceptible to it. The most famous discussion of *deisidaimonia* occurs in the *Characters*, a short tract by Aristotle's student and successor Theophrastus, whose purpose was to present the reader with a catalogue of various personality types. Among those enumerated is the type that suffers from *deisidaimonia* or superstition, which, in his words, is a form of cowardice with respect to the divine. People of this type are mechanical and fastidious in their observance of ritual. They live in a state of anxiety and are for ever concerned with the proper observance of rituals no matter how trifling or strange. To cite one example, "upon seeing a crazy person or an epileptic, with a shudder he spits into his bosom."

Writing some 400 years later, Plutarch informs us in an essay devoted to table talk that belief in the evil eye was a superstition that could be ridiculed by the educated classes of his day. In a separate tract *On Superstition* he discusses more fully the meaning of *deisidaimonia*. In his view, it is akin to atheism, the latter resulting from the former, but not vice versa. Furthermore, *deisidaimonia* arises from false reasoning and is characterized by an almost pathological fear of the divine.

Accordingly, a fundamental tenet of *deisidaimonia* is a belief that the

gods are evil and visit misfortune upon man, whereas the atheist attributes such misfortunes to chance.

For Christian writers *deisidaimonia* was a convenient term with which to attack traditional pagan belief. In this way Clement of Alexandria, writing his *Exhortation to the Greeks* during the last half of the 2nd century AD, labels non-Christian belief *deisidaimonia* and calls its believers superstitions. In this work, *deisidaimonia* has a sense of demon worship characterized by festivals and sacrifice. While exceptional, it is worth noting that the author of Acts depicts Paul applying this word to the Athenians in the positive sense of “godfearing”. Despite this, the general trend throughout antiquity for Christian and pagan alike was to view *deisidaimonia* as negative. In more modern times it is worth noting that the *Didaskalia Patriki* from the 18th century equates superstition with a belief that Christianity depends upon its Churches for survival. Here the emphasis on symbol over faith appears to be the distinguishing mark of superstition.

Syllabary, Cypriot

The syllabic writing system used on Cyprus from the Bronze Age to the Hellenistic period

It is more precise to speak of “Cypriot syllabaries” than “the Cypriot syllabary”, for there have been discovered many forms of syllabic scripts on Cyprus, corresponding to at least two distinct languages (probably more), and dating from the 16th to the 3rd centuries BC.

The earliest syllabic script on Cyprus, the vehicle of a language commonly called “Cypro-Minoan”, remains undeciphered. This script has been found on objects dating from the 16th to the 12th centuries BC, including clay tablets, vases, cylinders, and balls, various objects of bronze, copper, and silver, and cylinder seals. The script generally runs from left to right, though a few short inscriptions run from right to left, and at least one is written in boustrophedon fashion (“as the ox plows”, running alternately right to left and left to right). At least 85 distinct signs have been identified, each probably representing a complete syllable – i.e. a vowel sound or a consonant–vowel

combination, but not an unvocalized consonant (as in a true alphabet). The subject matter of the Cypro-Minoan inscriptions is obscure, of course, since the script is undeciphered, but the inscriptions appear to serve practical purposes: personal names to identify ownership, records of economic transactions, and lists of names and objects. Even in the present state of ignorance about the language underlying these inscriptions, the fact of there being so many inscriptions on such a variety of objects, all distributed over a wide area, conveys the idea of a general population on Cyprus that had achieved at least a limited degree of literacy by this early period.

The Cypro-Minoan script and the Linear B syllabic script of the Greek mainland stand in equal relation to the Linear A syllabic script of Crete, both Cypro-Minoan and Linear B being offshoots of the even more ancient Linear A. The relationship between these three syllabic scripts was not understood at first, but it is now generally accepted that even the earliest Cypro-Minoan inscription, a small fragment of a clay tablet from Enkomi (on the east coast of Cyprus) containing three lines of text with 20 distinct signs and dated to the late 16th century, is derived directly from Minoan Linear A. Perhaps as many as 18 of the 20 distinct signs on the Enkomi tablet have parallels in Linear A, while none of the 20 signs has been found in any Near Eastern script. This confirms what had been well known from other archaeological evidence: that Cyprus during this period was within the orbit of Minoan Crete. It implies further that epigraphic contact between Crete and Cyprus may date as far back as the late 17th century BC. As this is well before the arrival of Greek-speaking Mycenaeans on Cyprus, the source of the early Cypro-Minoan script can now be confidently ascribed directly to Minoan Linear A, without the intermediation of Mycenaean Linear B.

The script of the Enkomi tablet is the prototype of the three subcategories of Bronze Age Cypro-Minoan (CM) script, which have been classified by type of text, location of find, and writing style: CM 1 (the local script from all over Cyprus), CM 2 (from Enkomi), and CM 3 (from the region of Ugarit in Syria). As such, it is also the ancestor of the second major category of syllabaries on Cyprus: the later Archaic and Classical Cypriot syllabary.

While the Archaic and Classical Cypriot syllabary is epi-graphically the natural evolution of the Cypro-Minoan, the language conveyed by the Cypriot syllabary has been understood for over 100 years, its decipherment having been initiated by George Smith in 1871. The language is Greek. Mycenaean Greek traders had begun to focus their attention on Cyprus from as early as the late 15th century BC, and trade between the two countries – as evidenced by the vast quantity of Mycenaean pottery that continues to be found on Cyprus, as well as by

the juxtaposition of Mycenaean and Cyprian goods recently discovered in the underwater excavation of a Bronze Age trading vessel wrecked off the coast of Ulu Burun – grew enormously in the 14th and 13th centuries BC. Finally, in the wake of the disturbances that inundated the Mediterranean at the end of the 13th century BC, large numbers of Mycenaean Greeks, displaced from their palace states on the Greek mainland, fled both westward and eastward, one of the more attractive destinations being Cyprus.

These Mycenaean refugees brought with them their language – a dialect of Greek now designated Arcado-Cypriot – which they began to transcribe in the writing system already in place on Cyprus. Like the Linear B syllabary on the Greek mainland, the Cypriot syllabary served this purpose adequately; and the fact that some of the later Cypriot signs – *na*, *se*, *pa*, *po*, *to*, *ti*, *ta/ da*, and *lo/ro* – are nearly identical to Linear B signs of the same value shows that some crossfertilization occurred. The Cypriot syllabary has the same five vowel sounds as Linear B, and the consonant sounds are only slightly different (the labio-velars are absent; *t* and *d* are not distinguished, while *l* and *r* are). But unlike Linear B, the final consonants *-n*, *-r*, and *-s* are noted, and consonant clusters and diphthongs are fully spelled out. The ideograms that are so common on the Linear B tablets are absent in the Cypriot inscriptions, and, unlike Linear B, the writing direction of the Cypriot script is usually from right to left, perhaps owing to Semitic influence. The system as a whole is somewhat more streamlined, with only 56 distinct signs in the Cypriot script in comparison to the 87 distinct signs of Linear B.

The earliest inscription in the Cypriot syllabary, found in Palaipaphos in southwestern Cyprus and dating from the 11th century BC, is on a bronze spit; it contains five signs – *o-pe-le-ta-u* – which can be recognized as the genitive case of a Greek name, presumably that of the owner of the spit. The next earliest extant inscription does not occur until the 8th century BC, and inscriptions do not become common until the 6th. These are mostly funerary and dedicatory inscriptions on stone, metal, and clay. A very long inscription dating from 480–470 BC, containing more than 1000 signs, has been found in the city of Idalium, in central Cyprus. It is a large bronze tablet engraved with a promise from the king of Idalium to grant plots of land as a reward to a family of physicians who had operated without pay on those wounded in battle during a siege of the city by the Medes. The corpus of Cypriot inscriptions continues to grow as excavations on Cyprus continue, and it can now boast around 1000 members.

It is a matter of some surprise that although the Greek alphabet, modelled on the Phoenician, was apparently current on Cyprus from

the 8th century BC on, the syllabic system continued to be preferred until at least the Classical age. But eventually inscriptions began to be written digraphically, with the Cypriot syllabary and the Greek alphabet written side by side, until the spread of Hellenization under Alexander the Great tipped the scales in favour of the alphabetic system.

As an addendum, it should be noted that several inscriptions in the Classical Cypriot syllabary, some as late as the 4th century BC, found especially in the city of Amathus on the south coast of Cyprus, cannot be deciphered as Greek. This unknown, non-Greek, perhaps native language is conventionally called Eteo-Cypriot. Its relation to the undeciphered Cypro-Minoan of the Bronze Age remains obscure.

Symi

Island in the Dodecanese

The Aegean island of Symi lies to the north of Rhodes, of which the nearest point is 24 km away, and almost equidistantly between the two rocky mainland peninsulas of Cnidus and Dorakis, the latter some 10 km to the south; with an area of 64 sq km it is one of the smaller islands of the Dodecanese.

Symi is mentioned briefly in the writings of Herodotus, Strabo, and Pliny, but it was the 6th-century ^{AD} grammarian Stephanus Byzantinus, drawing on Classical authors, who provided most of the early information on the island's origins. Initially called Metapontis and Aegle, the island apparently obtained the name Symi from the daughter of Ialysus, called Syme; it was she, with Chthonius, a son of Poseidon, who was held to have first populated the island. At several points in its history the island was deserted, but was finally (according to Diodorus Siculus, 5.33) populated by Argives and Lacedaemonians. In the *De Thematribus* of Constantine VII Porphyrogennetos (913–59) the island is listed in the 14th theme, named Cibyrreote. When Christopher Buondelmonti wrote of the island in his *Liber Insularum* of c. 1420 he claimed that its name derived either from Simatis, who had been king of the island, or from *sima*, the Greek vernacular for “near”, in reference to its proximity to Asia Minor.

The island's history is dominated by its involvement with the sea, the Symiots being renowned boat builders, sponge fishers, and swimmers. The prowess of the men at building boats was already acknowledged in Homeric times, since during the Trojan War the hero Nireus, the son of Aglaia and king Charopus, is reported (*Iliad*, 2. 671) to have gone with a contribution of three ships from Symi to assist Agamemnon in the Trojan expedition.

Symposium

A *symposion* was a drinking party. It was also the setting from which much of early Greek poetry and philosophy emerged.

The focus of research on symposia is on Greek cities of the 7th to 4th centuries ^{BC}: during that period, several forms of evidence concur in demonstrating their crucial importance in Greek culture. They are to be observed in the archaeology of private houses and of temples, in

sculpture, in the form and the iconography of vases, and in poetic and prose literature. But if we look for origins, the different kinds of evidence lead us in different directions.

Symposia took place in purpose-built rooms, *andrones* (“men’s rooms”), easily recognized by archaeologists because they were designed to take a certain number of couches (usually 5, 7, or 11) around the walls. Sometimes there are surviving floor markings to show the placing of the couches and of the small serving tables. Participants reclined, one or two to a couch. The custom of reclining at banquets and drinking parties is traced to the 7th or 8th century BC in Greece, to the 6th or 7th century BC in Etruscan Italy, and to the 8th century BC or earlier in the Levant and Mesopotamia. The idea thus appears to have spread westwards, and has been linked with Phoenician trading contacts.

Symposia followed an evening meal. Food did not mix with conversation or with cultural pursuits. After eating, a libation of neat wine marked the beginning of the drinking; the libation was mainly for the gods, however. Wine, in large quantities, was then mixed with at least equal volumes of water for the symposium itself. The ideal strength of the mixture was a matter of argument: it was decided on each occasion by the host or by a participant who was chosen as *symposiarchos* (“party ruler”). Mixing was done in a large vase (*krater*). Vase paintings show how attendants ladled wine from the *krater* into individual cups. *Krateres*, accompanied by drinking cups, are well known from Classical Greece (and Greek vases were exported in great numbers to Etruria, where they are found as grave goods), but there are also vases of similar forms from much earlier sites in Greece and the southern Balkans, suggesting that the wine-mixing ritual is to be traced back locally to prehistoric times.

Vase paintings depict many other details of the typical or ideal symposium. Sweets, dried fruit, and nuts accompanied the wine. Toasts were drunk, often praising the beauty of boys; some vases appear to have been commissioned as mementos of this. Music was played, both by participants and by slave entertainers such as the ubiquitous “flute-girls” (*auletrides*). Philosophy, politics, and many other topics were discussed; poems and songs were recited. Dancers, acrobats, and prostitutes might be hired. Drunkenness supervened – slowly, since the wine was diluted – but almost inevitably, since not to drink was a cause for mockery and the proceedings might well last all night. Symposia allowed free speech and the release of inhibitions: proverbially, things said and done there were to be forgotten, or at any rate not to be betrayed, the next day.

In Greece the symposium was essentially an activity for those of citizen status, and for men only. The latter was apparently not true of

Levantine drinking parties and certainly not of Etruscan ones. In Greece any women who were present were slave entertainers or *hetairai* (courtesan) and in either case sexually available; participants' wives and daughters were not to be seen. The presence of adolescent boys, under the aegis of a parent or a lover, may be regarded as a form of initiation into adult male society.

There was a genre of short poems composed specifically for recitation at symposia, *skolia* or drinking songs. There is persuasive evidence that much of the rest of early Greek poetry, including elegy, iambus, and monodic lyric, was typically performed at symposia too. As a setting for philosophical discussion symposia appear in different, but complementary, lights in the *Symposium* of Plato and the *Symposium* of Xenophon, in both of which Socrates is depicted as a participant. These two works mark the beginning of a literary genre of dialogues with a sympotic setting and, in general, with moral, philosophical, or scholarly themes; examples survive by several much later authors, including Lucian and Plutarch.

While feasting might often be a municipal, and an essentially public, activity, symposia may be seen as essentially private. How far the practice was common to different social classes must have varied from place to place. In the Archaic period, for example, symposia are integral to the aristocratic society depicted in the lyrics of Alcaeus and Anacreon; they are not apparent at all in Homer or Hesiod, though aspects of sympotic behaviour have been observed in the feasts of the *Odyssey* and *Iliad*. In Classical Athens, if we may judge by the written sources, people who went to symposia consisted of a fashionable, cultural, and political elite; others did not know how to behave at such a gathering, or even how to recline elegantly, as Streptocleon teaches his father Bdelycleon to do in an amusing scene from Aristophanes' *Wasps*. Some participants were wealthy enough to act regularly as hosts, while others were perpetual guests or *parasitoi*, tolerated or welcomed for their entertainment value.

It is far from clear how long into Hellenistic or Roman times the symposium remained a living institution. In the 2nd century AD Plutarch's *Symposium Questions* claim to be based on social gatherings that were similar to Classical symposia in their intellectual content if not in their sexual freedom. This is the latest significant source for symposia as a feature of contemporary society.

Syracuse

City in Sicily

Syracuse (modern Siracusa) was the leading city of Sicily virtually from its foundation in 733 BC until its sack by the Arabs in AD 878. It was founded by Corinthian colonists led by Archias, one of the Bacchiad aristocracy of Corinth, who placed his settlement on the island of Ortygia which was well supplied with water: the spring of Arethusa on the waterfront was potable until an earthquake early in the 19th century allowed sea water to seep in. Myth related that, as the nymph Arethusa fled from her lover Alpheus, Artemis saved her from rape by changing her into a spring and her wooer into a river. Strabo claimed that the Alpheus river in the Peloponnese flowed underground to Syracuse where its water mingled with the spring.

The earliest settlers monopolized the land, reducing the native Sicels to serfs, and they became a landowning aristocracy called the Gamoroi. The city prospered, pulling ahead of its nearest rivals Gela and Acragas. It had outgrown Ortygia by the mid-6th century BC, when the island was connected to the mainland by a mole and the population spilled into the Neapolis area. A temple to Apollo was built c.565 BC (it is considered the earliest of Sicily's great Doric temples), and it was soon followed by a temple of Olympian Zeus outside the city, south of the river Ciane. In 485 BC the Gamoroi, who had been expelled by a popular uprising of the Syracusan commons and the Sicel serfs, appealed to Gelon, tyrant of Gela, who took Syracuse easily and transferred his headquarters there, conscripting new citizens from Gela and expanding at the expense of Syracuse's neighbours. In 480 BC he destroyed a Carthaginian invasion force at Himera on the north coast, and one monument of this is the Doric temple of Athena which was transformed into the cathedral of Syracuse in AD 640 and is still in use.

Gelon's brother Hiero (478–467 BC) succeeded him as tyrant, but he was a harsh, unpopular ruler, and a year after his death a general uprising ousted his brother and successor Thrasbylulus, and founded a

democracy. Yet Syracusan politics were still unsettled at the time of the ill-fated Athenian attack (415–413 BC) which ended with the annihilation of the Athenian forces. Hermocrates, the hero of the Syracusan resistance, was no supporter of democracy, and after the Athenian debacle, when he left Syracuse to lead a squadron of warships to help the Peloponnesian allies, the democratic statesman Diodes persuaded the city to adopt a new constitution and lawcode. Hermocrates was banished in 409 BC, but he returned to Sicily, and in 407 BC he was killed attempting to force reentry into Syracuse.

Yet one of his followers, Dionysius “the Elder”, did manage eventually to seize power and he held it until his death 38 years later. Early in his tyranny Syracuse narrowly avoided capture by a Carthaginian army, which was first weakened by pestilence and finally utterly defeated by a Syracusan attack. Refugees from Acragas, Gela, and Camerina enlarged the city’s population, and Dionysius strengthened its defences with walls along the triangular Epipolae ridge and the Euryalus fort (modern Castello Eurialo) at its apex. Dionysius’ son and namesake was of a different stripe. Good-natured, impractical, and ultimately oppressive, he toyed with the idea of becoming a Platonic statesman with Plato as his adviser, and for three years (357–354 BC) his step-uncle Dion, having seized power, tried to play the philosopher king and succeeded only in becoming a despot. He was killed by his own soldiers in 354 BC and Syracuse lapsed into anarchy which not even Dionysius II’s return to power seven years later could remedy. Finally, with Greek Sicily depressed and Carthage threatening again, Syracusan exiles appealed to Corinth, which sent Timoleon who ousted Dionysius, defeated Carthage, and revived Syracuse.

After Timoleon’s death another revolution in Syracuse brought in an oligarchy, and in 317 BC Agathocles seized power, backed by mercenaries from Campania and exiles from the Greek cities. He vigorously resisted the encroachment of Carthage, even invading Carthaginian territory in Africa itself, while at home the conduct of affairs seems to have been peaceful. Disorder followed his death in 289 BC until around 270 BC, when Hiero II began his reign of more than 50 years. Hiero II was a paternalistic despot who shrewdly allied himself with Rome in the First Punic War, and consequently, when Sicily became a Roman province, Syracuse remained a free Roman ally and a centre of Greek culture which could claim the poet Theocritus and the scientist Archimedes. Hiero’s successor, his grandson Hieronymus, reversed his policy, but did not live to see the result. A coup overthrew him, and out of the bloodshed that ensued, a pro-Carthaginian faction seized control and Rome laid siege to the city. Syracuse resisted valiantly, helped by the ingenious devices

designed by Archimedes, and Carthage sent help, but disease carried off much of the Carthaginian army. Hope vanished by the autumn of 212 BC, and traitors opened one of the gates of Ortygia. In the pillage that followed, Archimedes was killed by a Roman soldier who failed to recognize him.

Syracuse now became the seat of the praetor or governor of the Roman province of Sicily, and we get a glimpse of the city under Roman rule in Cicero's orations against Verres, a corrupt governor who looted the province. It suffered in the civil war following Julius Caesar's assassination in 44 BC, and the emperor Augustus planted a colony there in 21 BC.

Modern Syracuse is rich in monuments of the Graeco-Roman past. In Ortygia there are the badly damaged temple of Apollo, c.565 BC, and the temple of Athena, now the cathedral, c.480 BC. There are also remains of a large unfinished Ionic temple, which would have borne comparison with the great Ionic temples of Hera on Samos and Artemis at Ephesus. On the mainland is the temple of Olympian Zeus, c.550 BC, where two columns still stand. The great Greek theatre was remodelled frequently for different uses, and there is a small, unexcavated Roman theatre that was probably used for drama when gladiatorial games became the staple of the Greek theatre. The fortifications of the Epipolae ridge have been extensively modified since they were built by Dionysius I. The great altar of Hieron II was built between 241 and 215 BC for mass sacrifices of victims when the festival of Zeus Eleutherios was held, and the Roman amphitheatre (3rd century AD) is one of the largest still in existence. The Christian catacombs are more extensive than in any other city except Rome.

Syria

The name Syria is variously used in ancient sources. At its widest it is applied to the whole area from the Egyptian border to the Taurus mountains covering modern Israel, Phoenicia, Jordan, Lebanon, and a small part of Turkey. More often Palestine and Phoenicia are excluded from it. In late antiquity Syria was subdivided into ever smaller provinces. Greek traders were active at the Syrian trading centre of Al Mina at the mouth of the Orontes river from around 825 BC. At first they shared it with Phoenicians; later they almost monopolized the emporium. In the late 8th century BC Euboeans predominated. In the 7th century BC the most common pottery was Corinthian, from the later 6th century BC Athenian. Through this trade oriental skills came to Greece at the end of the Geometric period: gold workers learned techniques of granulation, filigree, and inlaying; craftsmen, especially potters, decorated their wares with oriental imagery, with sphinxes, griffins, roaring lions, and lions fighting men. Greeks heard stories about the origin of the world and the birth of the gods that were to be reshaped by Hesiod and to become part of the Greek heritage.

Al Mina remained an important centre until after the conquest of Syria by Alexander the Great (331–333 BC), when it was replaced by Seleuceia, founded 6 km to the north in 301 BC by king Seleucus Nicator, founder of the Macedonian Seleucid dynasty that was to rule Syria until Pompey turned it into a Roman province in 64 BC. At the time Syria had few and small towns and as part of his policy of settling veteran soldiers and immigrants from Greece Seleucus founded ten cities: the biggest was Antioch; second-order cities were Seleuceia, Apamea, and Laodicea; others were Beroea (Aleppo), Chalcis, Cyrrhus, and Zeugma. All were laid out on a grid plan and were given the political institutions of a Greek city. Subsequently Greek culture became exceedingly popular all over greater Syria, and ruling groups everywhere gradually adopted Greek ways, local gods were identified with Greek deities. Young men took up athletics. Wealthy men spent money to provide Greek-type civic amenities for their fellow citizens. So the Greek way of city life spread from the Greek colonies to native towns and larger settlements. Only among the Jews, thanks to the revolt led by the Maccabee family (168/67 BC), was Hellenization checked.

When the Romans took over Syria they divided the province into

city territories and delegated most administrative tasks to the civic authorities. So cities flourished under Roman rule and Hellenism in the cities. While a large part of the country population, and a considerable part of the urban population as well, must have retained their Aramaic language and traditional customs, all visible aspects of their way of life, the architecture of temples and houses, the images of gods, the language of monuments and tombstones, came to be almost exclusively Greek. The earlier literary traditions of the area, except those of the Jews, appear to have faded out. What knowledge we have, for instance about the Phoenicians, has been transmitted through Greek writers. By the 2nd century AD all Syrian inscriptions, except at Palmyra which had a bilingual culture, were in Greek or occasionally in Latin. It was only in late antiquity that Aramaic inscriptions were once more displayed in Syria. This was a consequence of Syriac becoming a literary language in Mesopotamia, especially at Edessa and Nisibis, in an environment that was bilingual in Greek and Aramaic. Syriac was used by Christians in Mesopotamia, and became the liturgical language of the Monophysites in Mesopotamia and Syria, and of the Nestorians in Persian Mesopotamia. Some works composed in Greek have survived only in Syriac translation and Syriac hymnography strongly influenced the development of the Greek kontakion, or short hymn.

T

Tarentum

City in south Italy

The city of Tarentum (modern Taranto), a colony of Dorian Sparta, was situated on the north coast of the gulf of Tarentum facing the Ionian Sea. The acropolis is perched on a peninsula between two harbours – a main outer harbour and an inland tidal lagoon. It was one of the best ports in southern Italy, with access to good cornlands in the interior.

The literary tradition records that the site was founded in 706 BC (Eusebius, *Chronica*, 91b Helm); the archaeological evidence supports this date. Myth relates that the settlement was established by a group of *Partheniai*, the illegitimate offspring of helots, or slaves, and Spartan women, led by their founder, the *oikists* Phalanthus. The Delphic oracle directed the settlers to found a colony on the south coast of Italy, rather than closer to home in the Peloponnese, in effect legitimizing colonization by means of war and conquest. What is certain is that this was a group of dissatisfied Spartans, perhaps remnants of the pre-Dorian population or others disenfranchised in the aftermath of the First Messenian War (743–724 BC), affected by a social crisis involving land and status. The site was established through the conquest and expulsion of the native inhabitants – Iapygians, Peucetians, and Daunians. Tarentum is unusual in that it had a “double” founder; the second was the eponymous hero Taras, the mythical leader of the pre-Greek Iapygian settlement.

The area was known to the Greeks, especially the Rhodians, from the Mycenaean period on through trade. Despite this long history of contact, the original settlement expanded only slightly to the southeast in the Archaic period, as the inhabitants were afraid of the native tribes. In the late 6th or early 5th century BC Aristophilides appears to have ruled according to a constitutional model based on that of Sparta, with kings and ephors – officials elected both by lot and by vote. The colony retained Spartan cults in their new homeland, continuing to worship Apollo Hyacinthus, and Spartan rituals, such as the burial of the dead within the city walls. It also continued to maintain close ties of kinship with its mother city. There are few remains of the Greek city today because modern Taranto occupies the same site, but Strabo (6. 3. 1) mentions an Archaic Doric temple thought to be dedicated to Poseidon (late 6th century BC), an altar to Aphrodite, a sanctuary of Demeter and Persephone (containing

terracotta votive offerings from the 7th and 6th centuries), and other religious structures.

In the early part of the 5th century BC Tarentum enjoyed victories over its Messapian and Peucetian neighbours (c.490 and 460 BC), taking slaves and expanding along the coast to the southwest. The city commemorated these events with the erection of a monument at Delphi. In c.475 BC, though, it suffered a crushing defeat at the hands of a native confederation led by the Iapygians, and much of the aristocracy was destroyed, providing the impetus for the establishment of democracy (Herodotus, 7. 170). At the end of the 5th century BC the settlement began to expand once again, filling the vacuum left by the destruction of its rival Croton, a powerful city to the west. This expansion brought Tarentum wealth and power, and it now became the leading Greek centre in southern Italy. In 433 BC the city founded a colony itself at Heraclea (Policoro) on the west coast of the gulf, which acted as a counterweight to the Athenian colony at Thurii, and served as the new head of a league of Italiot Greeks. It was allied with Syracuse in the Peloponnesian War, contributing ships to the cause and sending corn to Sparta, in an attempt to offset Athenian power in the region as well as support its mother city. Consequently it was invaded by the Athenians.

Tarentum began to develop a reputation for possessing many great works of art. Among others, Pythagoras of Rhegium created a famous statue of *Zeus and Europa* which graced the city centre. In the same period the Apulian school of pottery, founded by Greeks who came from Thurii to Tarentum, established its centre in the city (c.420 BC). This school was known especially for its representations of myth and comic parodies on the vessels it produced. Much of what we know about Greek theatre today is illustrated by the images painted on these vases. Terracotta figurines and antefixes were also widely exported from the city.

Tarentum attained its greatest wealth and power in the 4th and 3rd centuries BC, at which time it became the pre-eminent city in Magna Graecia, renowned for its luxuriousness. The extent of its wealth and political power is indicated by the great number of goods produced in the city, as well as its attractive series of coins, which were distributed widely around the shores of the Mediterranean Sea. In the early 4th century BC politics were dominated by Archytas, a Pythagorean philosopher-mathematician and friend of Plato, who expanded Tarentine influence in the area. After the mid-4th century BC the city's difficulties with the surrounding native tribes increased, and it requested help first from Sparta, and then from a series of mercenary princes and kings. Initially it called upon Archidamus III of Sparta (338 BC), who died in battle. Then Alexander I of Epirus came to its

aid. In the beginning he was successful, but was eventually slain c.330 BC. The next call for help was directed to Cleomenes of Sparta, who also ultimately failed.

Tarentum was host to many famous residents and visitors in this period. Aristoxenus, a philosopher and musician, developed his theory of harmonics there. Rhinton was a comic dramatist who popularized *phylax* farces – local productions that drew on daily life for their inspiration. It was famous as well for its fine works of art, both large and small. At this time Lysippus of Sicyon created a large bronze statue of *Zeus and Hera* for the city. It was a major centre of production for votive figurines of terracotta, primarily religious in nature, which were precursors of the well-known Athenian and Tanagran types. It was also known for its limestone architectural sculpture adorned with human figures.

Towards the end of the century, the inhabitants of the city became fearful of the growing power of Rome, and felt threatened by Roman aid to the nearby cities of Thurii, Locri, and Rhegium. Despite having signed a treaty in 303 BC, in the early 3rd century Tarentine forces attacked Roman ships in the harbour and insulted the Roman ambassador. These actions precipitated war with Rome. Tarentum once again enlisted the help of an Epirot ruler, Pyrrhus, who responded to its request in 281 BC. The Tarentines were soon joined by the native tribes of the Bruttians, Lucanians, and Samnites. At first Pyrrhus enjoyed a number of successes, especially against the Carthaginians in Sicily, but the city felt threatened by the king's growing power and his plan for a united kingdom of Sicily and lower Italy, and withdrew its support. Upon Pyrrhus' departure, the Romans took over in 272 BC, forcing territorial concessions from the Tarentines. The city became an ally of Rome in 270 BC and the struggle for the control of central Italy was over, with Roman domination of lower Italy now assured. Many of its art treasures were carried off to Rome. At this time the city was the home of Livius Andronicus, a Greek-born slave, who produced comedies, tragedies, and a Latin translation of the *Odyssey*. He played an important part in the creation and development of Latin literature.

A group of Tarentine aristocrats revolted in the Second Punic War (218–201 BC) and went over to Hannibal (213 BC), who fortified the lower city, but it was retaken by Rome in 209 BC. The extension of the Via Appia and the founding of Brundisium (Brindisi) undercut its trade, and part of its territory was confiscated. The city declined from this period on, although it probably regained allied status in 180 BC. It subsequently received colonial status and became a provincial Italian town, but there is much epigraphical evidence of civic activity and mention of the importance of its products – wool, textiles, purple dye

made from the processing of murex shells, and agricultural produce. Strabo maintained that the city was still linguistically and culturally Greek in his time (6. 1. 2), but this is controversial. Horace (*Odes*, 3. 5. 53–56) described it as a suitable holiday place for a tired businessman.

Taxation

The earliest Greek taxation system that can be discussed in detail is that used by the kingdoms that ruled Greece in the Mycenaean period. In this system each village was responsible for producing specific amounts of individual commodities such as wool and wheat. Taxes were thus of the direct variety and were paid in kind, i.e. with produce rather than with money.

The simpler forms of government that arose after the collapse of Mycenaean civilization adopted equally simple forms of taxation. The ruler (a relatively weak king) was given the use of a piece of public land, the produce of which supported the royal household and paid for the few public functions that were undertaken.

The more complex forms of political organization that arose around

800 BC made use of three basic taxation systems. The simplest of these was used exclusively by Sparta, which was ruled by a fairly numerous military elite. The members of this group were exempt from all taxes and were fully supported by mandatory contributions in kind levied on the serfs assigned to each individual's estate. Apart from small gifts presented to royalty, no other regular taxes existed.

The second system of taxation of interest here was used primarily in cases where the state was ruled by a limited number of individuals. Examples include Corinth under the Cypselid family (c.650 BC) and Athens under Pisistratus and his sons (c.540 BC). This system relied on direct taxes imposed on the entire population. The most important imposts were a 10 per cent levy in kind on agricultural produce and a yearly fee (a head or poll tax) due from each individual. Indirect imposts, including customs duties and sales taxes, also played a role. The payment of direct taxes by the entire population was a reflection of the concentration of political power.

The link between political power and taxation is also evident in the third system, which is most clearly known from its manifestation in democratic Athens (510–322 BC). Democracy entailed the participation of a substantial number of citizens, who expected to be compensated for their services. At the same time, the obligation to pay direct taxes was seen as a form of subservience. The existence of a democratic government thus meant that a significant revenue stream had to be generated without the imposition of direct levies on most of the state's residents.

A vast variety of indirect taxes were levied on all Athenians. These included customs duties, sales taxes, and levies on banking transactions. Direct taxes in the form of a head tax were paid only by resident aliens. However, the limited number of non-citizens made direct taxation on citizens unavoidable. This taxation took the form of "liturgies". A liturgy was a governmental expense, such as the maintenance of a warship, that was assigned directly to an individual. The liturgist was responsible for providing all necessary funds to complete the designated project. In Athens the wealthiest residents, both citizens and aliens, served as liturgists. This practice was politically expedient since it provided government financing without the use of a direct tax.

The practice of imposing liturgies also simplified the state's administrative duties. The vast number of individual taxes that were imposed and the fact that Athenian taxes were due in the form of money rather than in kind made the collection and supervision of revenue a complicated process. Liturgies provided one solution to this problem by uniting taxation and expenditure. Tax farming was another solution.

Rather than appointing agents to collect taxes, the Athenian state auctioned off (“farmed”) the right to procure the revenues generated by a particular impost. In exchange for an advance payment to the state, the tax farmer was granted the right to collect a specific impost for a specific period of time. This practice had two advantages. First, the administrative demands placed on the state were greatly reduced. Second, the yield of each impost was known and acquired in advance. This greatly simplified the process of planning and financing government expenditure.

This system of taxation was shaped by the diffusion of political power engendered by democracy. Other Greek states with democratic government structures took a similar approach to taxation. The political evolution of Greece, however, moved in a direction that made such situations unusual. By the end of the 4th century BC most of Greece was ruled by large kingdoms. The taxation system used by these kingdoms bore a striking resemblance to that used in earlier Greek states ruled by a limited number of individuals. Direct taxes in the form of levies on agricultural produce and a head tax were the primary sources of government revenue. The needs of the kingdoms were such that taxes were levied in monetary form, which again complicated the process of collection. This prompted the use of tax farming.

Technology

Technological discoveries and importations from elsewhere are

notoriously hard to date in the ancient world. Many techniques leave little or no archaeological evidence and literary mention is sporadic and incidental before the Hellenistic period. Even then from the 3rd century BC we have little other than the Aristotelian *Mechanical Problems* (perhaps by Straton, the head of the Lyceum from c.287 to 269 BC) which, though primarily theoretical, does deal with problems in applied mathematics involving levers, compound pulleys, etc. The inventor Ctesibius wrote a treatise on pneumatics (now lost but used by later authors), while his contemporary Archimedes, apart from a lost treatise on how to build a spherical planetarium, chose deliberately to write only theoretical mathematical treatises. Around 200 BC Philon of Byzantium composed a compendium of technology whose main concern was the construction of mechanical devices: surviving books deal mainly with pneumatics and war machines. More remains from the Roman period. The tenth book of Vitruvius' Latin treatise *De Architectura* (c.25 BC) details relevant technical devices largely drawn from Greek predecessors. The great *Natural History* of the Elder Pliny (mid-1st century AD), despite its title, ignores virtually no field of human endeavour and preserves much information from lost Greek sources. His contemporary Heron of Alexandria is our principal authority for ancient technology, although his books on mechanics survive only in an Arabic translation and in extensive quotations by the 3rd- to 4th-century Pappus of Alexandria. From the Byzantine period little of use was written and even less survives: in the 4th century Oribasius described mechanical constructions for resetting dislocated limbs; the 5th-century alchemist Zosimus described chemical apparatus and recipes for smelting, dyeing, etc.; while, unfortunately, most of the treatises on mechanics and hydraulics by Anthemius of Tralles (the innovative architect of Hagia Sophia, Constantinople) are lost. Later works are almost entirely mere reworkings of inherited knowledge.

Until the Hellenistic period the Greeks largely used technology that was already existing in the eastern Mediterranean at the time of their arrival in the late 3rd millennium BC, and remarkably few advances were made. The conservative attitude of the Classical period, known in many other areas for exuberant originality, is sometimes attributed to the existence of slavery, but is more probably due to a cultural attitude of the intellectual elite which elevated "pure" far above "applied" knowledge. Even the famous black- and red-figure Attic pottery in the Archaic and Classical periods depended upon a refinement of a technique known as early as the Middle Helladic age (c.2000–1500 BC). The Attic potters placed their pots, painted with a clay slip containing iron oxides, in a wood-fired kiln which with the air vents open produced an oxidizing phase, thereby turning both

painted and unpainted parts red, up to a temperature of 800°C, between which and 945°C closure of the vents and the introduction of smoke-producing green wood created a reducing phase in which the whole pot turned black. Subsequently the temperature was allowed to decrease and at about 900°C the vents were reopened to create the final, reoxidizing, phase in which the unpainted parts became red again while the sintered areas remained black.

The most advanced technology before the Hellenistic period was probably metallurgy: alluvial gold was caught in fleeces; gold and silver were extracted from lead by cupellation; and ore-bearing rocks were pounded and washed or heated in a blow- and later bellows-heated furnace to separate metal from gangue. The ability to attain a temperature sufficiently high to form iron blooms for hot-hammering (first managed perhaps by the Hittites c.1400 BC) was the single most important technological change in Greek history and may have been partly responsible for the downfall of the mainly bronze-using Mycenaeans. Alloys, especially of copper, were developed for specific purposes and soldering was practised. Implements were made by hot- and cold-hammering or casting (including the lost-wax process). Decorative processes included repoussé work and niello inlays (both known in the Mycenaean period), filigree, and granulation. Metal tools in the Classical and especially Hellenistic periods became increasingly precise. Notably carpentry was provided with hammers, chisels, saws (including the frame saw), and planes, while surgery benefited from a wide range of specialized implements. Locking devices also became increasingly ingenious.

The farmer raised water with the *shaduf* (swing-beam with compensating weight). Tillage of the soil was accomplished through the hoe and the usually ox-drawn ard-plough; seed was broadcast by hand from a container slung round the neck; harvesting was done with sickles; grain was separated from chaff by flailing or threshing, in which centrally tethered animals were driven round a threshing floor and the chaff carried away by a breeze when tossed in the air by hand with the grain from a winnowing basket or by a winnowing fan; milling was done in querns. There was little change in agricultural methods until the addition of the threshing sledge, animal- and water-powered mills, and the rare animal-driven reaping machines in the Hellenistic and Roman periods.

Raw, wetted pelts were moulded over hard cores into containers which became stiff when dry. Cleansed pelts cured with salt or sun-dried were rendered imputrescible and water-resistant by numerous vegetal tanning agents with varying resultant colouration, but there is also some evidence for tawing by minerals. Malleability could be achieved by chamoising, the subsequent rubbing with animal fat,

which is mentioned already in the *Iliad*.

Spinning was done most commonly by twisting carded wool (or other fibres) drawn from a distaff on to a suspended spindle to which was attached a whorl to steady rotation. Weaving was done on a warp-weighted vertical loom, the threads alternately hanging straight down or passing over a horizontal shed-rod. Different weaves were attained by manipulation of heddle-rods. During the Roman period the loom at which a standing weaver pushed the weft upwards with the weaving sword gave way to one at which a seated weaver pressed it down with a comb, which was itself replaced in turn by a horizontal version. Specific looms for specific fibres were also being designed.

The Hellenistic and Roman periods were by far the most productive time of technological development in Greek history. Nevertheless, despite important practical advances, especially in the areas of building and war machines, even then a love of theory resulted in the invention and description of many contrivances of such great inefficiency that, even if models were ever built, they could not have served any practical purpose. Most notable in this respect are Heron's descriptions of a ball revolving on its own axis through the emission of steam from angled vents, and his device for covertly opening (and closing) temple doors by the pressure of air heated by fire on an altar forcing water to flow into a bucket which in turn tugged cords wrapped around a subterranean extension of the door-posts. On the other hand his related description of figurines making libations when a fire was lit on an altar is eminently feasible, as is Philon's automaton that alternately handed guests a pumice stone and poured water for washing, which led ultimately to similar but far more complex robots in the Islamic world. Toys, such as Heron's automatic theatre which could mechanically produce a puppet show in several acts, were probably made for amusement, while ingenious hydraulic devices that gave moving figures to fountains were to have a long history. One Athenian device of the mid-4th century BC was certainly of practical benefit: the stone *kleroterion* precluded jury-rigging by enabling black and white balls to fall randomly from a hopper down a tube at the side of a series of rows in which potential dicasts had inserted their metal tickets.

In mechanics we find that the lever, which had been known since the Neolithic age, had multifarious applications (e.g. for raising objects and as a steelyard). While the lever-press became common (the wedge-press was also invented), perhaps the most surprising anticipation of the modern world to employ the lever was a slot machine for dispensing ritual water upon insertion of a coin (but whether this was ever constructed or is merely theoretical is not known). The winch and the pulley (both known much earlier

separately) were combined in hoisting- and pulling-engines, while compound pulleys became increasingly effective (often incorporated into cranes powered by human treadwheels). The endless rope or belt, however, seems not to have been employed for transmitting power but only when itself driven, as in the bucket chain for the raising of water (activated by a treadwheel). Both horizontal and vertical capstans were widely used, while Drachmann (1973) believed that the crank had been invented by Archimedes and underwent subsequent experiments, although strangely this simple but efficient mechanism never enjoyed widespread application until the later Middle Ages, and certainly never appeared in antiquity with a connecting rod.

Of great importance was the invention of the screw-line ("the snail on the cylinder"), attributed to Apollonius of Perge, a younger contemporary of Archimedes who promptly employed it in his *cochlea* ("water-snail") for the raising of water. Screws were used more for moving and adjusting than for holding down (in which role they first appear in gold-smithery). Corresponding female screws made large presses (e.g. fullers' and olive-presses) more efficient than the alternative lever- and wedge-presses. Female screws were first cut into a split block which was then rejoined, but Heron describes a machine for their manufacture. The impossibility of making them small, however, meant that many instruments (e.g. the gynaecological *specula matris*) had to use the inferior method of a screw with an engaged peg.

Cogwheels, of wood for large machines and of metal for small, were employed for transmission in four ways. The rack and pinion is first attested in a water clock made by Ctesibius, but is not found again until Heron's toys (e.g. a self-snuffing lamp). Archimedes is credited with both inventing and employing in war machines the endless screw (the worm-and-wheel gear), but it does not appear again until Heron, who used it for, among other devices, his surveying instruments the *dioptra* (theodolite) and odometer. Chronologically next probably comes the use of parallel engaging wheels. Although these were generally inefficient owing to an inability to find the optimum shape, there has been found in a shipwreck off the island of Antikythera a calendrical celestial computing mechanism from c.80 BC (the sole surviving machine from antiquity) containing three brass dials and 31 cogwheels of different sizes with teeth in the shape of equilateral triangles: that this was actually used is proved by the evidence of repairs. Toothed wheels engaging at right angles are not attested until Vitruvius, who describes an undershot water wheel that gives motive force to a corn mill, a device of longterm practical benefit. (An overshot wheel is depicted in the Roman catacomb of S. Agnese in a representation of probably the 3rd century AD, probable remains of one

from the 5th century have been found in the Athenian Agora, and a certain example has been recently excavated from 9th to 10th century Byzantine Thebes. The wind-driven wheel, mentioned for Seistan, Afghanistan, in the 10th century AD, did not appear in the Greek world until the 14th apart from a miniature experimental usage by Ctesibius.)

In hydraulics and pneumatics the most important advance was in the increasing application of the syphon (used earlier for mixing liquids), which led not only to ingenious toys and drinking vessels (such as one still made in a Chiot village) but to the ability to force water to rise in aqueducts (at Pergamum in the 2nd century BC the citadel was served at 155 m above the lowest level of the aqueduct). Ctesibius' experiments in pneumatic machines, such as his organ (operated from a keyboard) in which water pressure forced air through pipes, led him to the invention of the force pump with cylinders and plungers operated by horizontal levers and vertical connecting rods. One adaptation for fire fighting had a nozzle that could be swivelled in any direction and tilted both ways. Surviving examples of pumps have both flap valves and the superior spindle valves. Ctesibius also improved the accuracy of timekeeping by ensuring a uniform flow in the *klepsydra* (water clock), to which he attached, in addition to all manner of entertaining automata, a figure with a pointer to indicate the hours on a column. Vitruvius describes a later water-driven clock which more efficiently adjusted the varying length of ancient hours on a revolving disc engraved with the zodiacal constellations.

Of great practical value was the development, probably in Hellenistic Syria c.100 BC, of glass blowing. Hitherto only modelled around a core of sand or poured into a mould when molten or carved when cold by hand or lathe, glass now became a common and relatively cheap material for vessels of daily use. More expensive articles were subject to an exuberant range of decorative processes including marvering, trailing, engraving, and painting, while openwork cage cups were carved from thick blanks. Gold glass, in which gold leaf carved into patterns or figures was placed between layers of transparent glass, appears to be an early Hellenistic innovation. Lenses are known from the Bronze Age onwards, but they remained a craftsman's (engraver's) tool and are not mentioned in any theoretical treatise on optics. By the 5th century BC they were being employed also as burning mirrors. Glass was used in addition for reflecting mirrors (sporadically from c.600 BC as cosmetic aids and later both for signalling and in lighthouses), for lamps (from the Hellenistic period), in small panes for windows, and in sheets cut into tesserae for mosaics (both from the Roman period). Stained glass was

developed, if not perhaps invented, by the Byzantines.

Textiles

Textiles are highly perishable and rarely survive the ravages of time. Our knowledge of them comes from a variety of sources, including archaeological finds, pictorial representations, and written sources.

In the Near East the use of flax to make linen cloth predates silk, cotton, and the domestication of sheep for wool by several millennia. The oldest textile in the world, a woven linen fabric adhering to a tool excavated at Cayonu in southeastern Turkey in 1993, is dated to about 7000 BC; wool did not appear in the Balkans until about 3500 BC.

The history of textiles in Greece begins in early Minoan Crete (c.2300 BC) where excavations at the prehistoric village of Myrtos turned up the first evidence for cloth production: sheep bones, tubs for washing wool, bowls for wetting linen thread, and clay spindle whorls. These finds indicate that the Minoans knew how to spin both flax and wool. Remnants of cloth from other sites in Bronze Age Greece and Turkey reveal the human penchant for decorating cloth. At Troy, for example, Schliemann found a linen textile embellished with tiny blue-green faience beads from c.2600 BC.

Evidence from later Minoan Crete and Mycenae (1600–1150 BC) tells the story of a flourishing textile industry. The men tended flocks of sheep in the countryside; women spun yarn and wove cloth in the palaces. The sheep were caught and plucked, because shears had not yet been invented to cut the wool from the sheep's back. Early breeds of sheep moulted fine wool from their coats, leaving the bristly kemp hairs, which moulted later. The wool was brought to the palace and weighed, then distributed for cleaning, combing, and spinning. The oils and fats were removed from the wool and retained for use in perfumes and ointments. Spinners worked in groups; weavers worked in pairs. Greek women did not spin on wheels, but on spindles. The spinner held the fibre-laden distaff in her right hand; from this she drew out the fibre and twisted it into thread with the aid of a spindle weighted with a whorl. Large numbers of ancient spindles and whorls have been found in archaeological digs.

The warp-weighted loom, for which ancient Greece is well known in textile history, was apparently already in use among Mycenaean weavers around 1400 BC. The Linear B script lists "cloth with white edges" or "cloth with coloured edges", indicating the use of starting bands typical for weaving on warp-weighted looms. (The starting bands were made by specialists who wove on small band looms.) These bands stabilized the warps which were suspended from a horizontal bar on vertical supports. The warps were anchored at the

lower end with clay weights. A shed rod divided the warps, half in front, half at the back. The rear warps were attached to a heddle rod which, when lifted, created a shed through which the weft was inserted. The weft was beaten upwards, towards the horizontal bar, with a sword-like shuttle. Herodotus wrote of “pushing the woof [weft] upwards”. Generally the looms were no taller than the weaver’s reach, although one depiction of a warp-weighted loom shows the weavers wearing platform shoes to gain height. With warp-weighted looms, the length of the cloth was limited to the height of the loom. However, the loom allowed the manufacture of wide cloth with three finished edges.

Minoan artwork depicts elaborately patterned and coloured textiles, implying advanced weaving skills and a knowledge of dyeing. Patterns include rosettes, grids of tiny diamonds, and spirals. Such patterns could have been embroidered, painted, or woven. Wool, the most common fibre, was easy to dye. The known dyestuffs included two classes of dyes, direct and vat. Direct dyes, unlike vat dyes, required the addition of a mordant, probably alum, to fix the dye to the fibre. Minoans and Greeks used direct dyes such as madder roots and scale insects called kermes to obtain reds; saffron lilies yielded yellow. Woad and murex shells were the two main vat dyes, the former yielding blue, the latter purple. The Minoans may have exported their patterned textiles to Egypt where, according to Barber (1991), they were copied and used for canopies and banners.

Textile making was women’s work in Greece. Homer’s *Iliad* and *Odyssey* suggest that weaving was a task fit for queens in Mycenae and Troy. While living in Troy, Helen wove “a purple double-layered cloak” depicting the struggles of the Trojans and Achaeans. Odysseus’ wife Penelope spent three years weaving a complicated pictorial cloth by day, unravelling it at night in an attempt to dissuade suitors who believed her long-absent husband was dead. Women were so important to the Mycenaean textile industry that raiding soldiers captured them to weave as captive labourers. So many were brought to Mycenae that they most likely made textiles for export. In Classical Greece women of all ranks spun and wove. Mastery of such household tasks signified a virtuous female. A 6th-century BC vase in the Metropolitan Museum of Art in New York shows women participating in all phases of textile work from weighing the wool fibre to folding the finished cloth. Woven textiles were used for clothing, bedding, hangings, cushions, towels, banners, burial shrouds, and sails. Greek women were proficient at other textile techniques besides weaving, including a type of knotless netting called “sprang”. Vase paintings show women working with small frames to make elastic-like fabrics, probably for hairnets.

Only a few textile fragments survive from Classical Greece. The royal tomb at Vergina in Macedonia, believed to be the final resting place of Philip II of Macedon, father of Alexander the Great, contained a fragment of a purple cloth embroidered with gold. A funerary urn from Koropi, near Athens, held a fragment of linen embroidered in gilt silver in a diaper pattern with small lions in the centre of each lozenge. Several specimens unearthed in a Greek colony in the Crimea comprise tapestry-woven, embroidered, painted, or resist-dyed textiles incorporating either scenes from Greek mythology or geometric motifs.

Cotton, hemp, and silk appeared by the 5th century BC, attesting to the extensive trade networks developed by the Greeks. Cotton originated on the Indian subcontinent, hemp in northern Europe, and silk in China. Several purple and white silk textiles found in a late 5th-century BC tomb in Athens raise questions about when silk arrived in Greece. Silk is the only filament-length fibre in nature, and silk fabrics were thus prized for their smooth, lustrous surfaces. China, Korea, and Japan kept knowledge of sericulture, the raising of silkworms for fibre, a closely guarded secret while exporting both fibre and finished fabrics to the Mediterranean world. Although wild silk was known in the Classical era, was not until trade routes were developed across Asia that cultivated silk was brought to Greece and Rome during the Hellenistic period. According to legend, around AD 550 two Byzantine monks smuggled silkworm eggs and mulberry leaves out of China and presented them to the emperor Justinian, who subsequently established the cultivation of silk in Byzantium.

During the Graeco-Roman period an important technical change occurred. Around the 4th century AD weavers began to work on horizontal looms that had two rigid bars, one for warp and the other for finished cloth. This loom allowed for longer, but narrower fabrics. The transition from vertical, warp-weighted looms to two-bar horizontal looms can be seen in the changing construction of numerous tunics that survive from Coptic Christian burials in Egypt (3rd to 12th centuries AD). These tunics were made of undyed linen with tapestry sections of dyed wool.

Thasos

Island in the north Aegean

Thasos is the most northerly of all the Aegean islands, lying only some 7 km from the Thracian coastline of northern Greece, where the mouth of the Nestos river forms a low promontory. Its ties with the mainland were always close, and it is today governed from the port town of Kavalla. The mountainous interior of Thasos, rising to more than 1100 m, is thickly wooded, and the whole island has an area of just under 400 sq km. Its rich endowment with mineral wealth has been a source of contention throughout its history: from its mines of gold, silver, and marble that were particularly famous in antiquity, to the substantial installation of a German mineral mining and exporting complex at Limenaria still in operation after World War II, to offshore oil deposits discovered in 1974, the natural mineral endowments of the island have shaped its history.

Both Herodotus (6.47) and Pausanias (5.25) claimed that the first people to occupy Thasos were Phoenicians, traditionally led by Thasos, son of Poseidon, but archaeological evidence has not supported this, and Parian settlers were in occupation by the early 7th century BC. The wealth that they accumulated, deriving from the island's gold mines, was the cause of the island twice being attacked during the 5th century BC, by a tyrant of Miletus and, in 463 BC, by Athens. Herodotus wrote that he had seen the mines "where a huge mountain has been overturned in the search for *metalla*". In 340 BC Philip II of Macedon occupied Thasos, and it remained in Macedonian hands until the Romans took over the island in 196 BC.

Thasos was the birthplace of several personalities of cultural importance in antiquity: the 8th- to 7th-century BC poet Archilochus was among the colonists from Paros; the 5th-century BC rhapsodist and historian Stesimbrotus was a native of the island, as was also the famous athlete Theogenes. But the most famous of all the natives of Thasos was Polygnotus, who was to be numbered among the most

distinguished of all Classical Greek painters. Pliny (*Naturalis Historia*, 35.58) described how he was the first artist to “represent the mouth as open, showing the teeth, and relaxing the rigidity which had been usual before”, and he also introduced the painting of women in transparent drapery. Descriptions of his paintings, by Pausanias and other writers, which could be seen all over the Greek world, provide ample evidence of his fame.

Theatres

The rituals of Classical Greek religion involved, above all, the observation by worshippers of actions performed for the gods. In addition to the crucial sacrifices at an altar, there were athletic activities, and the singing and dancing of choral odes, normally as part of a contest. Evidence for this survives from a wide variety of city states; even at Sparta choruses of young maidens danced and sang odes composed for them by poets of the highest calibre, a marked contrast to the superficially dour impression that is attached to that state. The area in which this activity took place formed part of the sanctuary of the god to whom it was dedicated, and in most instances no more was required than a space, usually circular, on which the dancers could perform their movements of turn and counterturn, and round about this, space from which the spectator-worshippers could observe the ritual.

It was out of this that the Greek theatre developed. Drama formed an elaboration of the choral ode, by the separating out of individual characters, performed by actors, from the body of the chorus. This did not happen in all the city states, and is most clearly associated with Athens; the plays whose texts survive were all written for performance at the religious dramatic festivals of Dionysus there. Nevertheless theatres form an extensive and widespread category of building, whatever precisely the type of production that took place in them. The form, however, is best understood in relation to the development of drama as we perceive it from the Athenian examples.

The principal theatre of Classical Athens is situated on the south side of the Acropolis, in the sanctuary dedicated to Dionysus. The circular dancing floor for the chorus was placed between the small temple and the lower slopes of the Acropolis itself, which provide a most suitable area for viewing. The architectural elaboration of this

into a developed theatre was protracted in time, and the earliest phases are inextricably obscured by the later, more permanent forms. Though the chorus remained an essential element in 5th-century BC drama, the separating out of actors would have required a distinct area for their performance, which we know took place in front of a structure that provided the setting. Much later accounts (in Vitruvius) talk of actual scenery and scene painting, but this may be something of an anachronism. There are, however, ample references to what are translated as stage buildings, the *skenai*, which may at first have been temporary. In the front of this (usually referred to by the Latin *scenae frons*) were doors through which actors emerged or disappeared. The convention seems to have been a single, central door for tragedy (which might serve, for example, as the palace of Agamemnon or the cave of Polyphemus), and probably three doors for comedy. These gave on to a stage, the height of which above the level of the dancing floor (the orchestra), failing the survival of material evidence from the 5th century BC, is perennially disputed by modern scholars. Actors, particularly those taking the role of messengers, could also come on to the stage from either side without going through the stage building. Within that structure there was provision for ancillary apparatus, particularly the “machine” (*mechane*) used for the sudden appearance of deities (hence the “god from the machine”, the *deus ex machina*) which often brought to an end the otherwise insoluble dilemmas created in the plays of Euripides. In Athens in the 5th century BC the auditorium was provided with wooden seating, presumably removable, which seems to have been arranged in a polygonal rather than curved plan.

Everything became more durable in the 4th century BC. The size of the auditorium was enhanced by extensions from the natural slope on terraces supported by massive end walls. Permanent stone seating was placed on this, a development attributed to the statesman Lycurgus, in 346 BC, and the stage building was also translated into stone. This general arrangement is now found in other places, and culminates in the construction of the great theatre at Epidaurus. This was begun, probably, in the 330s BC, though development was slow, and work was still being carried out in the following century. There is a large circular orchestra, with a stage building behind, the details of which unfortunately are lost, only the foundations surviving. The seating is on a natural hillside, extended out with terraces on support walls and in plan occupying more than a semicircle. The rows of seats are divided into “wedges” by stairs. Twelve wedges form a semicircle, with a further wedge each side to the terrace walls. There is a middle walkway dividing the seating into lower and upper sections, the upper being possibly an addition to the original plan; here each wedge is

further subdivided by an additional stairway, but with only a half-wedge beyond the semicircle. The resulting acoustic qualities are superb, as can be attested in modern performances, although such qualities are more a natural consequence of the layout than the result of deliberate planning. Though small roofed auditoria (*odeia*) were built specifically for musical performances, theatres remained essentially open-air, and so could accommodate large numbers. Epidaurus holds more than 10,000, and this is not unusual. Some later theatres, such as those at Ephesus, Miletus, and Pergamum, are even larger.

There is an interesting theatre of c.300 BC at Sicyon, where access to the auditorium was facilitated by two tunnels under the upper section of seating, leading to the walkway dividing the upper from the lower area. These were roofed with tunnel vaults, indicating a Macedonian design and the work of Demetrius Poliorcetes, who ruled over a reduced kingdom here following the defeat and death of his father at the Battle of Ipsus in 301 BC. In Macedon itself there had been a theatre a century earlier, for king Archelaus, who had enticed Euripides to his court, but the surviving theatre at Aegae has only the lowest row of seats in stone, the remainder being wooden on an earth bank. This was the scene of the great wedding procession in which Philip II was murdered. This procession demonstrates how theatres were used for activities that were not, in themselves, dramatic in character. Theatres also served as meeting places for political assemblies, and there is evidence for such use even at the theatre of Dionysus in Athens.

The best-preserved stage building is that of the theatre at Priene in Ionia, which is probably 2nd century BC in date. The stage platform is raised high above the orchestra level, and has in front a row of engaged Doric half-columns, with openings between. Behind the stage the *skene* rose for another storey, with the traditional doorways. Such a stage separated the actors from the chorus, and presumably reflects a decline in the importance of the chorus, which can be seen clearly in the Athenian comedies by Menander of the late 4th century BC. Even so, as well as these plays, the Athenian drama of the 5th century BC was still performed; a guild of professional actors, the “tradesmen of Dionysus”, based in the Ionian city of Teos, seems to have gone on tour with such productions, and every self-respecting Greek city now required a theatre for them.

This continued after the Greek cities were assimilated into the Roman empire. It is possible to distinguish Greek from Roman theatres by the later truncation of the auditorium to a strict semicircle, and linking its ends to a high *scaenae frons*, usually with two or three storeys of attached columnar decoration framing the traditional three doors. Such theatres were built in Rome itself and the western

provinces, but those in the Greek areas usually kept enough space for the choruses, even if one suspects that they were not always used solely for revivals of classical drama. But the distinction is primarily a chronological one, and the semicircular plan was evolving already in late Hellenistic theatres. Improved Roman construction methods, particularly vaulting techniques, made it simpler to build theatres on flat ground, though if a suitable hillside was available it would be used; even in the 4th century BC Greek architects could build auditoria with seats resting entirely on artificial terraces, as at Mantinea and Eretria.

By the time of the Roman empire the religious significance of the theatres had largely passed. In the troubled times of the late empire theatres were often incorporated, by virtue of their massiveness, into fortifications. In Byzantine times plays were still written, but as literary exercises, rather than for performance. Theatrical performances in the Greek world continued only with the travelling players who still entertained in villages even in the early years of the 20th century, though without dedicated buildings. The new theatres of independent Greece, like the splendid example at Piraeus, were based rather on western and specifically Italian models.

Thebes

City in Boeotia

Thebes was the capital of Boeotia, set in its eastern basin with an area of some 12,400 sq km. Centrally located within this basin, Thebes commands the large, fertile Aonian plain to the north, and is near the Asopus valley to the south. The Teneric plain lies only some 7 km to the west. The area is also blessed with ample springs, rivulets, and

rivers. Hence Thebes controlled a large, cohesive area of rich, arable land, which meant that it could easily extend its power throughout Boeotia. The city also enjoyed access to the Aegean by way of Aulis. Thebes itself was likewise endowed with a constant, dependable supply of good water. The acropolis of Thebes was the Cadmea, a plateau that rises gently from north to south, reaching a height of 63 m. It has always been the principal site of inhabitation.

Thebes did not become a major city until the Mycenaean period (c.1600–1250 BC). Archaeology has revealed two palaces, other buildings, and walls pierced by the famous seven gates of Thebes. The Mycenaean city appears early in the realm of Greek legend. Some ancient traditions attribute its founding to the Phoenician Cadmus, but other legends tell of founders who preceded him. No modern evidence supports the Cadmus legend: even though Cadmus gave his name to the citadel, the settlement was purely Greek.

Thebes entered the historical era in the Archaic period (c.600–500 BC). The city grew until it spread its influence abroad in Boeotia. By the middle of the 6th century BC it had helped to forge a loose confederation that was originally a religious amphictyony, marked by a festival in honour of Poseidon. The confederacy gradually served as the inspiration for political unity, and as such its members repulsed a Thessalian attack around 520 BC. Succeeding it was a rejuvenated league that came into conflict with Athens, an enmity that became traditional. These events show a clear and growing Theban policy that sought to strengthen the confederacy and to oppose Athenian ambitions in the region.

The bleakest moment in Theban history occurred when the city sided with the invader during the Persian Wars. Although in 480 BC Thebes defended Thermopylae against the Persians, the other Greeks suspected it of harbouring Persian sympathies. Abandoned by its allies after the loss of Thermopylae, Thebes fought with the Persians against the Greeks at Plataea in 479 BC. Thereafter, Thebes was branded as a traitor to the Greek cause. Following the Greek victory, it fell to a successful siege, but the rest of Boeotia was spared. The aftermath of the defeat was an eclipse of Theban power and authority. The confederacy survived, but only in 457 BC did Sparta strengthen Thebes by making an alliance with it, reaffirming its hegemony of the confederacy, and enlarging its circuit wall. Seeing these developments as a threat, Athens immediately attacked Boeotia, only to be repulsed by Sparta and Thebes at Tanagra. Later that year Athens struck again, routed Thebes at the battle of Oenophyta, and overran Boeotia. The unpopularity of Athenian rule prompted a successful rebellion in 447 BC that resulted in a Boeotian victory at the Battle of Coronea and the expulsion of the enemy from Boeotia. The victory led the major cities

of Boeotia to create a new confederacy that conducted all federal business. It was the most innovative, comprehensive, and successful federal government of the Classical period, and helped to make Boeotia a major power in Greece.

Thebes played a disreputable role at the outbreak of the Peloponnesian War, attacking Plataea before the formal beginning of hostilities. Ally and enemy alike considered Thebes guilty of having violated the yet unbroken peace. Nevertheless, in 424 BC Thebes defeated a major Athenian army at the Battle of Delium, and afterwards contributed significantly to the ultimate defeat of Athens. Victory in 404 BC brought the submission of Athens and strife with Sparta: Sparta insisted on a hard but fair peace with the vanquished; Thebes, on the contrary, demanded the complete destruction of Athens. It also unsuccessfully demanded from Sparta a tenth part of the spoils of war. Thebes thenceforth displayed coldness to Sparta and warmth to Athens. Antagonism gave way to open hostilities during the Corinthian War (395–386 BC). With the encouragement of the Persians, Thebes banded together with Athens, Argos, and Corinth to overthrow Spartan power in Greece. Fighting was at first fierce, with Thebes and its allies defeating Sparta at the Battles of Haliartus (395 BC) and Coronea (394 BC) and holding their own at the Battle of the Nemea River (394 BC). The war thereafter dragged on until Sparta, with vast Persian support, forced its enemies to accept peace. The King's Peace of 386 BC dismantled the Boeotian Confederacy and weakened Thebes.

Not content with humbling Thebes, Sparta sought to enfeeble it. In 382 BC a Spartan army seized Thebes in time of peace, and held it with a garrison. After four years of military occupation the Thebans overthrew the Spartans and rebuilt the confederacy. In 371 BC Thebes, under its two brilliant generals Epaminondas and Pelopidas, annihilated the Spartan army at Leuctra, thus inaugurating the era of the Theban hegemony, a decade when Thebes stood at the pinnacle of Greek politics. During that time it destroyed Sparta as a major power, frequently invaded the Peloponnese, and spread its influence northwards to Thessaly and Macedonia. In 366 BC Thebes won the friendship of the Persian empire. After a fruitless attempt to win naval superiority, Epaminondas made one last effort to reassert control over an unruly Peloponnese, but failed. At the battle of Mantinea in 362 BC Thebes won the victory but lost Epaminondas. That victory, ironically, ended the hegemony.

If the years after the Theban hegemony were anticlimatic, they were nonetheless eventful. In 355 BC Thebes came to the defence of the sanctuary of Pythian Apollo at Delphi. Seized by a band of Phocians whom the Amphictyons had found guilty of sacrilege, the shrine was militarily occupied and systematically plundered. Thebes and many

other Amphictyons struggled to liberate Delphi from the Phocian temple robbers in a conflict known as the Sacred War (355–346 BC). Exhausted after years of unavailing warfare, Thebes and Thessaly turned to Philip II, king of Macedon, for succour. Together with the Amphictyons, Philip freed Delphi in 346 BC. His triumph propelled him to prominence throughout the Greek world, on the heels of which came a conflict with Athens that drew him further south to confront his enemy. Thebes and a few other Greek states now saw Philip as a threat to Greek freedom. In 338 BC Thebes, Athens, and some other allies suffered disaster at the Battle of Chaeronea. In its heroic resistance to this threat from the north, Thebes redeemed itself for having earlier sided with the Persians.

Chaeronea marked the end of Thebes' greatest days. In their place came a long period of twilight. Under the Macedonian kings it was generally at the mercy of greater powers. In 335 BC Alexander the Great punished a rebellious Thebes by utterly destroying it. Rebuilt in 316 BC by the Macedonian king Cassander, the city fell to Demetrius Poliorcetes in 290 BC. From 315 to 86 BC the fortunes of the city changed with those of Hellenistic and Roman commanders. Thebes and Boeotia alike suffered years of decline and decadence. The worst came in 86 BC, when the Roman Sulla reduced it to little more than a village.

Thebes has left a rich legacy. From the realm of legend come Heracles, Cadmus, Oedipus, the cycle of the Seven against Thebes, Antigone, and Tiresias. Indeed, Athenian drama would have been much the poorer without the seven-gated city. Pindar and Corinna wrote exquisite poetry, and Pindar's sophisticated verses are masterpieces of metre, variety, and content. In the Middle Ages Thebes became a steadfast seat of Christianity, a fundamental ingredient in the heritage of modern Greece and the world at large.

Themistocles c.525–459^{BC}

Athenian statesman

Themistocles first appears in our sources as archon of Athens for 493/92 BC, when he began fortifying the Piraeus, as a much superior replacement for Athens' former harbour at Phaleron. This first appearance exemplifies the central preoccupation of his career, that Athens should become a great naval power. It also exemplifies the legendary intelligence that all the sources emphasize. Similarly, in 483 BC, when a rich seam of silver was discovered at Laurium, he urged that it be used not for the short-term individual gain of the citizens, but to augment the Athenian fleet, which then numbered only 50, but would number 180 at Salamis. Whether Athens' ongoing dispute with Aegina or rumours of a Persian invasion were his focus, his policy was directly responsible both for Greece's unexpected victory against Persia and the thalassocracy on which the Athenian empire was based.

The climax of Themistocles' Greek career was his performance as commander of the Greek fleet at Salamis in 480 BC. Aeschylus himself fought at this battle, and his *Persians* and Herodotus are our most contemporary sources for what happened. Though there are different emphases in each, they agree that Themistocles forced the battle – in Herodotus, against the will of the Peloponnesians – by sending word to Xerxes that the Greeks were planning to retreat by night: Xerxes blocked off the escape routes and the Greeks and Persians were forced to fight. Themistocles' motives and the exact details of what happened are disputed, but his plan enabled the Greeks to fight in narrow waters, which were advantageous to them, but detrimental to the Persians, because of their superior numbers. It was widely acknowledged in Athens that the Battle of Salamis was decisive in saving Greece, and in Simonides' poem on the battle Themistocles' wisdom was especially praised. A sanctuary of Artemis and a trophy for the victory on Salamis were discovered in the 19th century, though little is visible today.

Themistocles foresaw that Athens' new prestige and power would eventually damage its relations with Sparta. When the Athenians began to rebuild their ruined city, and the Spartans suggested that refortification was unnecessary, Themistocles outmanoeuvred them as he had outmanoeuvred Xerxes. Ordering the Athenians to finish the rebuilding as quickly as possible, he went to Sparta, allegedly to discuss the issue there. By delaying and making excuses, he kept Sparta uncertain of what was happening in Athens until it was too late and the fortifications were established: Athens' credit was too good in Greece for the Spartans to complain openly, but they were not pleased, and this is an early sign of the tensions that would ultimately

lead to the Peloponnesian War.

In the spring of 478 BC Themistocles returned to the fortification of the Piraeus that he had begun in his archonship. Although events ultimately proved the wisdom of his plan, in the short term the decision worked against him. While Cimon and Aristides pursued glamorous foreign campaigns of revenge against Persia, Themistocles presided over the valuable but dreary and exhausting work of fortification at home. His desire for continuous expressions of gratitude for his services at Salamis also harmed him among the people, who became resentful, especially when he constructed a temple of Artemis of the Best Advice (Aristoboule) which contained his own statue. One of his supporters, however, may have been Aeschylus, whose *Persians*, performed in 472 BC, is sometimes interpreted as an attempt to remind Athens of Themistocles' services at a time when he was unpopular, although only a few lines concern him and he is never actually named. At any rate, Aeschylus was not enough to save him and, perhaps in 471 BC, he was ostracized. In fact, ostraca dating back to the mid-480s BC indicate that he had always had many enemies, and it is surprising that he had managed to avoid ostracism for so long.

He went to Argos, and it may be significant that Elis and Mantinea acquired democratic governments at this time. If he was stirring up democratic anti-Spartan feeling in the Peloponnese, it is not surprising that the Spartans wanted his removal. An opportunity presented itself when they put to death their own general Pausanias under suspicion of treason with Persia. Letters were allegedly found that implicated Themistocles, but before he could be arrested, he fled to Corfu. A strongly romanticizing strain, which seduced even Thucydides, colours the rest of his story: it probably derives from Themistocles himself and his descendants. Thucydides tells a stirring tale of hair's breadth escapes from capture, as Themistocles' ship was carried by a storm straight into the Athenian fleet besieging Naxos, until he finally landed in Persia, where he seems to have lived a life of obscurity for several years before approaching the Persian king. The dating for this part of his career is uncertain, for the obvious reason that his actions had to be so clandestine.

Later accounts describe his meeting with Xerxes' successor Artaxerxes, in which he won him over. Themistocles reminded the king that he had persuaded the Greeks not to break the bridges that had conveyed the Persians into Europe, thereby saving Xerxes. The story is told first in Herodotus, who interprets it – implausibly – as a sign that Themistocles was already planning to defect after Salamis, and the story may derive from Themistocles' own fertile imagination. Tradition recounts that he learned Persian in a year and became a

friend and adviser to the king, who gave him control of several towns, including Magnesia. He settled there happily, keeping up with his origins by introducing Athenian festivals into Magnesia, and issuing his own coinage on the Attic standard, of which some examples are extant. Aristophanes already knew of a tradition in which Themistocles committed suicide by drinking bulls' blood when the king insisted that he should repay his kindness by leading an expedition against Greece: this too may come from Themisto-clean sources, eager to erase any stain of disloyalty to Greece, and a natural death is more likely. For his descendants, honours were maintained in Magnesia even down to the time of Plutarch. It is likely that Themistocles' relatives eventually brought his body back to Athens: monuments to him in both Magnesia and Attica are recorded.

Though quite abundant, all accounts of Themistocles are shaped by the strong reactions, both positive and negative, that he elicited from his fellows. In Herodotus his greed and deception predominate, though his services to Greece are also acknowledged; for Aeschylus and Thucydides his "deceit" is cleverness, and Thucydides may deliberately have rehabilitated a man whose outstanding intelligence he regarded as equal only to that of Pericles. The life of Themistocles, with its exceptional triumphs and reverses, generated tremendous interest in later tradition. Some information on his life is historically valuable, though much is also of a purely anecdotal variety: strands of both types are clearly evident in Plutarch's *Life*. Because of his part in building the Athenian navy, he is regarded as Pericles' forerunner as a democrat, and sources tend to speak well or ill of him according to their judgements of democracy. Among philosophers, his character was a favourite test case on the relative roles of nature and nurture in creating intelligence, and rhetorical schools used incidents from his thrilling life as material for debates: these factors exacerbated the tendency for traditions to be embroidered even more as time went on, even to the extent of the forgery, probably in the late 1st or 2nd century AD, of 21 letters, allegedly written by Themistocles to friends from various stops along his escape route.

Theocritus

Poet of the 3rd century ^{BC}

Theocritus lived and worked in the first half of the 3rd century ^{BC}. A native of Syracuse, he was probably also active in Cos and in Alexandria under Ptolemy II Philadelphus. This peripatetic poetic career may be considered as characteristic of a period in which old loyalties to individual cities were eroded under the larger governmental units that were their successors. Theocritus is typical of his time also in his movement away from the older literary forms native to the Greek polis, such as epic and drama, and for his preference instead for creating new combinations within traditional genres out of his intimate knowledge of the Greek literary heritage, and mixing “high” and “low” literary forms, to create new poetic blends designed to appeal to a highly sophisticated audience.

Theocritus is best known for bucolic poetry, whose setting is the countryside and whose subject matter is herdsmen, their animals, their loves, and above all their songs. The countryside is highly idealized: specific indications of places and times are generally ignored in favour of timeless scenes that emphasize the abundance and beauty of the countryside, the sensual pleasures of its colours, smells, and sights, and the leisurely lives of the herdsmen. Theocritus likes to contrast the world of nature and simplicity with a larger world of civilization beyond it. His herdsmen partake of both worlds, being simultaneously portrayed with amusement as representatives of rustic simplicity, yet also admired as artists and creators of exceptional poetry. Thus his portrayal of them is never consistent and somewhat detached, and the tone of the poems moves constantly between the realistic and the idealized. This shift is also reflected in their form and language. Theocritus writes in Doric, but not the Doric actually spoken by Sicilian herdsmen, but a stylized mixture of contemporary and poetic forms, and while an occasional bawdiness colours the poems to give some illusion of reality, mostly he prefers a formal elegance and motifs that look unceasingly to his great predecessors for their inspiration. Although superficially his thought seems straightforward, with only occasional ventures into symbolism or obscure myths, these poems of simple country life are as much a product of Alexandrian literary taste as the more obviously learned poetry of Theocritus’ library-dwelling contemporary Callimachus.

The relation of Theocritus’ bucolic poetry to contemporary practice

in the countryside is unclear, but the repetitions and use of refrains that are such a notable stylistic feature in his poems are attested in other traditions of pastoral poetry. Furthermore, the singing contests of which he writes still exist – in a less self-consciously literary form – in modern-day Sicily, Crete, and Rhodes, and the capping of stanzas, the use of phonological and syntactical parallelisms, and the general spirit of display and mockery that Theocritus' herdsmen exhibit all feature in modern songs of this type. In ancient tradition there is also a consistent association of shepherds and herdsmen with music making, as is seen in the biographical traditions attached to Archilochus and Hesiod. Theocritus may possibly have been the first poet to make higher literature from traditions of popular song. If so, he is again typical of his time, since the high poetry of the Hellenistic age tended to rework elements from popular culture into new, literary modes.

Theocritus is best remembered for his poems of country life, largely because, via Virgil's adaptations of them in the *Eclogues*, they influenced later European pastoral poetry so strongly, but his extant corpus extends beyond these in subject matter, tone, and dialect. He addressed poems to the great men of the day, such as Hieron II of Syracuse, from whom he may, probably unsuccessfully, have hoped for patronage, and to Ptolemy II Philadelphus (who may have been more generous). Some poems are set in the city, such as poem 2, which is a monologue by a young woman using magic to retrieve her errant lover, and 15, a dramatic dialogue of two women in Alexandria and their day out at the festival of Adonis. The amusing realism of this poem and its interest in the lives of ordinary people reflect general tendencies in Hellenistic literature and art. These poems have an antecedent in the work of Sophron, a writer of mimes of the 5th century BC, a "low", but popular, genre of entertainment, and a parallel in the rather earthier mimes of Theocritus' contemporary Herodas.

Other poems are written in epic dialect, or in a mixture of epic and Doric, and Theocritus even seems to have imitated the Lesbian of Alcaeus and Sappho. Twenty-seven epigrams are preserved under his name, as is the novelty poem "Syrinx" written in the shape of panpipes. In his handling of epic themes, such as stories of Heracles and the Dioscuri, he shows the normal tendencies of this time to retell lesser-known stories in a domesticizing, small-scale style. His treatments of the myths of Heracles and Hylas and of the Dioscuri may be compared with those of Apollonius, which, by contrast, are in a more traditional epicizing mode. It would appear from these and other evidence that Theocritus was a devotee of Callimachus' small-scale aesthetic, rather than that of Apollonius.

At least one Theocritean poem, the *Berenice*, has not been preserved,

while several poems transmitted in the Theocritean corpus are the work of later imitators. Little bucolic poetry between Theocritus and Virgil survives, but Moschus in the mid-2nd century BC and Bion, c.50 years later, show a strong Theocritean influence. The first ancient collection of Theocritus was gathered by Artemidorus of Tarsus (1st century BC), and from the writings of Lucian, Longus, and others it is clear that bucolic poetry remained popular in the next century. Our papyri range from the 1st to the 7th centuries AD. A maintenance or revival of interest in bucolic is evident in the 4th to 6th centuries in the poems of Quintus, Nonnus, Tryphiodorus, and epigrammatists, some Christian writers, and also in the numerous papyri datable to the 5th century AD. To the pastoral renaissance in the Greek world from the 12th century on we owe a large number of Theocritean manuscripts – nearly 180 in all – and Byzantine scholars such as Planudes, Moschopoulos, Triklinios, and probably Tzetzes all wrote commentaries on his poems.

Although Theocritus' secure place in the Byzantine canon has ensured that relatively substantial remains of his work have come down to us, the Byzantine enthusiasm for Attic Greek has wreaked havoc with Theocritus' Doric forms, and has caused problems for modern editors trying to restore his original language. Throughout the 15th century Byzantine manuscripts came to Italy and Theocritus was one of the first Greek poets to be produced in printed form, in Milan c.1480. More people continued to read translations of Theocritus than the original, however, and he has been translated into many languages throughout Europe, including modern Greek. No other Greek author was as often and as successfully imitated as Theocritus, but his influence on western literature is primarily through Virgil whose Latin was more accessible to many more people than Theocritus' Greek.

Biography

A native of Syracuse, Theocritus was active in Cos and Alexandria in the 270s BC. He is famous for his bucolic poetry, which was the model for Virgil's *Eclogues*; but he also wrote mimes, epigrams, and minor epics. He was much read in Byzantium and has been translated into many modern languages.

Theophrastus c.371–c.287 BC

Philosopher

Theophrastus succeeded Aristotle as the head of the Lyceum in Athens. More than 200 works are attributed to him. Allowing for duplications because of confused titles and some works that are excerpted from larger ones, the volume of his writings spanning numerous subjects is enormous. Diogenes Laertius wrote Theophrastus' biography and related the testimony of numerous later authors who preserved quotations from lost works. Only a few of his works survived intact. Theophrastus' influence is measured in differing ways: the accomplishments of his students; the indirect influence through intermediary writers who summarized his ideas; the knowledge in his scientific works on mineralogy and botany; and his writings on philosophy and religion.

Among the 2,000 students taught by Theophrastus were Strato of Lampsacus (physics), Erasistratus (physiology), Demetrius of Phalerum (librarian at Alexandria), and Arcesilaus (philosophy). In the turmoil of Athens in the 320s and 310s BC, the works of Aristotle and Theophrastus did not circulate widely. In the arrangement of Aristotle's works by Andronicus of Rhodes (c.70 BC), some of Aristotle's writings may have been confused with Theophrastus' in what is now called the *Corpus Peripateticum*. At the very least, during the Middle Ages a number of small works and fragments of larger works circulated under Theophrastus' name, some of which are not now regarded as genuine. Conversely some works attributed to Aristotle (e.g. *On Colours* and *On Sounds*) were probably written by one or more of Aristotle's or Theophrastus' students or by Theophrastus himself.

While accepting most of Aristotle's ideas, Theophrastus broke with his mentor in a number of ways important in later Hellenistic, Islamic,

and Christian theology and natural philosophy. He challenged Aristotle's notion that to all things nature imparted a final cause, a direction towards which action takes place. Theophrastus said that nature does many things "at random" and that there is no discernible purpose for such things as the tides, breasts on men, and horns on deer. He also raised doubts about fire as an element: it alone generates and destroys itself; there are numerous ways in which it is born; it requires a substratum (something to burn); thereby, it cannot exist by itself. On motion, Theophrastus questioned why, if there was one mover (*primum mobile*), all heavenly bodies did not have similar motions; if such bodies have a desire for circular motion, does that not imply a soul in them?

Theophrastus' major surviving works now regarded as genuine are: the *Enquiry into Plants* (*Historia Plantarum*, 9 books: morphology, classification, habitats, uses including medicinal); *Plant Explanations* (6 books: generation, propagation, environmental factors including cultivation, seeds, degeneration, juices); *Minerals* (2 books: formation and differences among minerals and stones such as by visual and tactile qualities); *Metaphysics* (1 book which questioned some of Aristotle's ideas but was published in Aristotle's works); *Characters* (1 book: 30 profiles of personality types); and short works: *Odours*, *Meteorology* (preserved only in Syriac and Arabic), and *Senses* (in manuscript with Aristotle's treatises).

Theophrastus' importance is perhaps greater because of his influence on other writers than because of the direct knowledge from his surviving treatises. Some patristic writers knew him and, especially, Jerome quoted Theophrastus' work on *Marriage*, but he disapproved of Theophrastus' negative opinion, and Chaucer's Wife of Bath agreed with Jerome. Strangely, Theophrastus was less influential on Byzantine writers than on those in Arabic and later Latin. Eustathios referred to *Characters* and Michael of Ephesus knew of several of his works. Cicero said that Theophrastus placed more emphasis than Aristotle on the importance of fortune and worldly goods. Arabic writers knew of Theophrastus' philosophy and discourses on botany and minerals. In the west Theophrastus' works on minerals had indirect influence on lapidaries. The biggest impact came in the 15th and 16th centuries when a rediscovery of Theophrastus began with Lupus Castillunculus's translation of *Characters* (c.1430s) and Theodore Gaza's rendering of the botanical works (1453/54). The fields of botany (including pharmaceutical uses) and minerals were the centres of Theophrastus' considerable impact on the Latin Renaissance. Appropriately the first printed edition, by Aldine (Venice, 1497) combined both Aristotle's and Theophrastus' works.

Biography

Born in Lesbos c.371 BC, Theophrastus succeeded Aristotle as head of the Lyceum in Athens. His pupils included Strato, Erasistratus, Demetrius of Phalerum, and Arcesilaus. His writings ranged over many subjects including mineralogy, botany, philosophy, and religion. He died in Athens c.287 BC.

Theopompus 378/77–c.320^{BC}

Historian

Theopompus of Chios, son of Damasistratus, was one of the most

important historians and public men in the years leading up to and including the reigns of Philip of Macedon and Alexander the Great. Not much is known for certain about his life. Photios (9th century AD) wrote a detailed biography (*Bibliotheca*, 176 = T₂): he was exiled from Chios with his father; he later returned, thanks to a letter written by Alexander to the Chians; on the death of Alexander he fled to Egypt, where Ptolemy I Soter almost had him killed. While some of these details may be doubted, he did in fact write letters to Alexander, and Alexander did restore exiles to Chios. Although there are good reasons for doubting it, Theopompus is widely credited with being one of the pioneers of “oratorical” or “tragic history”, in part due to the alleged influence of the Athenian rhetorician Isocrates whose student he was later thought to have been. Certainly for his Roman readers he was thought of as a combination of historian and orator. In the Byzantine period his writing was known chiefly by lexicographers and grammarians, arising from the fact that he was not a canonical author. His work survives to us only in the form of later paraphrase and quotation (F. Jacoby, *Fragmente der griechischen Historiker*, 115). According to ancient testimonia, Theopompus was the author of a number of historical works and minor treatises: the *Epitome of Herodotus*, *Hellenica*, and *Philippica* on the one hand, and *On the Funds Plundered from Delphi*, *Against the Teaching of Plato*, and encomia of both Philip and Alexander on the other. Given the propensity in antiquity to epitomize works and then view those epitomes as different productions from the material from which they came, it is probable that Theopompus did not in fact write all of the above works. Far and away his most important contributions were the *Hellenica* and *Philippica*.

According to Marcellinus’ biography of Thucydides (chapter 45), both Xenophon and Theopompus completed their great predecessor’s history of the Peloponnesian War, which breaks off in the year 411 BC: in both cases, these works were entitled *Hellenica* or *Greek Affairs*. However, unlike Xenophon’s text, which reports events down to 362 BC (the second Battle of Mantinea), Theopompus took his narrative down only to the year 394 BC (the Battle of Cnidus). A claim by Porphyry that Theopompus plagiarized a portion of Xenophon’s history in his own work places its composition in the late 350s BC. A papyrus published in 1908 and subsequently called the *Hellenica Oxyrhynchia* was thought by some to be Theopompus’ *Hellenica*, though this claim has not won general acceptance. The two fragments of any real substance that survive from the *Hellenica* deal with the moral characters of the Spartan leaders Lysander and Agesilaus, in the same spirit as much of what survives from the *Philippica*.

The *Philippica* treated events between Philip II’s assumption of the

Macedonian throne in 359 BC and his death in 336 BC. It comprised 58 books, and must have been massive in scale. As the title suggests, it is an account of Greek history understood as unified by the activities of Philip; according to Polybius (2nd century BC), Theopompus chose to organize his text around Philip because “Europe had never before produced such a man as Philip, son of Amyntas” (8. 11. 1 = fr. 27). While Theopompus recognized the king’s importance for shaping the events of his age, he did not take a positive stance towards him. Indeed, quite the contrary: Philip is simultaneously a corrupting force in the Hellenic world, and his victory over the Greeks is proof of their decadence. Theopompus frequently engages in an analysis and evaluation of the characters of men and states, and he is especially interested in the detrimental effects of luxury: so, for example, famous Athenian statesmen are criticized for their personal failings (fr. 97, 99), and whole populations such as the Ardiaeans (fr. 40) and the inhabitants of Byzantium (fr. 62) are singled out for scorching moral censure. Some of Theopompus’ criticisms stem from personal bias as well as a dislike for democratic institutions. He can also offer positive evaluations of character: the portraits of Lysander and Agesilaus from his *Hellenica* are good examples.

With the exception of a few Hellenistic historians who were also interested in the question of moral decay and luxury (Timaeus, 4th–3rd centuries BC; Duris of Samos, 4th–3rd centuries BC; Phylarchus, 3rd century BC), Theopompus’ influence on subsequent historiography was not great. However, ancient readers were broadly familiar with his work. Critics such as Dionysius of Halicarnassus, Cornelius Nepos, and Lucian all point to Theopompus’ acerbity and censorious stance: he is, as Nepos describes him, “maledicentissimus” – the most abusive writer.

Theopompus’ work was known in some form by late anti-Atticist writers and lexicographers. Several of his fragments are taken from Stephanus of Byzantium (6th century AD); and, as noted above, the patriarch Photios provides an important biographical notice, as well as fragments of his work. Krumbacher (*Geschichte der byzantinischen Literatur*, 1. 232) adduces Theopompus as a precedent for the court historian Procopius of Caesarea (5th–6th centuries AD), but does not claim any direct influence.

Biography

Born in Chios in 378/77 BC, Theopompus was exiled from Chios with his father for sympathizing with Sparta. Allowed back by Alexander the Great in 333/32, he was exiled again on Alexander’s death and fled to the court of Ptolemy I Soter. According

to tradition he was a pupil of Isocrates and worked as an orator. In addition to various speeches and treatises, his principal works were historical: *Epitome of Herodotus*, *Hellenica*, and *Philippica*. He died c.320 BC.

Thessalonica

City in Macedonia

Founded by decree in 316 BC by Cassander, who subsequently became king of Macedonia, the city was named after his wife Thessalonica, half-sister of Alexander the Great. It comprised 26 older towns and hamlets of the region, whose inhabitants were encouraged to resettle at the new location. Some of these towns survived the foundation of Thessalonica, while others disappeared entirely. Thessalonica was to serve as the harbour of Pella, the Macedonian royal capital, which had become landlocked as a result of the sedimentation deposited by the four large rivers of western and central Macedonia. The city plan followed the Hippodamian system applied to contemporary cities, a grid of streets at right angles to each other. Despite its long and turbulent history since the Hellenistic era, through periods of great prosperity and times of hardship and instability, Thessalonica has preserved the main features of the original orthogonal layout, corrupted in times of overcrowding. Furthermore, the walls, which have defended Thessalonica since late antiquity, defined an area of 330 hectares, which – with some alterations mainly on the eastern side – became the confines within which the city developed until its expansion after the mid-19th century.

Owing to its geographical position Thessalonica prospered as a centre of commerce and industry and was already a wealthy city when the Romans conquered Macedonia in 168 BC after the battle of Pydna. Its inhabitants remained loyal to the imperial party during the civil wars that followed the assassination of Julius Caesar in 44 BC. Under the Romans Thessalonica acquired an additional military importance, since it often hosted army units on their way to defend the empire against enemies in the east or against hostile tribes of migrating peoples from the north. Indeed, the very routes that carried trade,

ideas, and wealth in times of stability were to bring raids, armies, and violence in times of instability, both on a large scale, as the Pax Romana, the lengthy period of peace inaugurated and secured by the Romans, was drawing to an end in the mid-3rd century AD.

Thessaly

Region of central Greece

Thessaly is an easily identifiable area, bounded by the Pindus mountains on the east, Pelion and Ossa to the south, and Mount Olympus to the north. In between there are two large plains, divided by a range of hilly country. These plains, at the centre of which lie Larissa and Trikkala, are much larger than any other comparable area in Classical Greece, and perhaps explain why Thessaly in both ancient and modern times has not followed the pattern of the rest of Greece. The climate is a little harsher. Thessaly never really developed the city state. The territory became Greek in 1881, well before Macedonia and Epirus, but long after the rest of Greece. Though more clearly Greek than either Macedonia or Epirus, it used to contain a large Turkish element in its population and still contains many Vlachs. It has an extensive coastline and a major port in Volos, but is far less bound to the sea than most of Greece. The olive and the vine grow less well, but traditionally Thessaly has been rich in horses, cattle, and grain.

Thessalians figure in the Homeric catalogue, and Achilles came from Pthiotis in the southeastern portion of Thessaly. The Thessalians of the Classical period appear from their dialect to have been a mixture of the original Homeric element and invaders such as the Dorians from the northwest. The latter appear to have ruled as an oligarchy with one of their number elected as *tagos* or leader of the whole of Thessaly. An early family to achieve prominence were the Aleudae, based on Larissa, but they lost favour through supporting the Persians. In the Peloponnesian War the Thessalians were generally on the Athenian side, but not very effectively. Jason of Pherae in the 4th century BC gained considerable power, but his assassination prevented him from anticipating Philip of Macedon, who easily gained control of a divided Thessaly. Thessalian cavalry formed an important part of Alexander's army, and Thessaly generally remained loyal to Macedon until the Roman victory at Pydna in 168 BC.

While the rest of Greece on the whole suffered under Roman rule, there are complimentary references in Latin literature to Thessaly's plains, mountains, and rivers. Lucan, though mainly concerned with mythology, gives a glowing tribute in his *Pharsalia*. A Roman colony at Dium and a good road from Thessalonica to Athens ensured a plentiful Roman presence, well attested by inscriptions. Larissa and Tricca (Trikkala) were the main towns. Towards the end of the 2nd century AD Apuleius paints a gloomier picture of brigandage and witchcraft. The barbarian invasions in the Roman empire's declining years sometimes reached as far as Thessaly, and when the Danube frontier finally broke in 602, western Thessaly was soon lost to the invaders with Byzantium maintaining a precarious control only over the coastline.

Thrace

Region bordering the north Aegean

Thrace and Thracians are the names given by the ancient Greeks to the territory and the people living in the region bordering the north Aegean. Neither the origin of the name nor the local name for this large territory is known. Over time the boundaries of Thrace changed. It was at its greatest extent in the 5th century BC when the Odrysian kingdom was established, stretching over present-day Bulgaria, east of the Hebrus (Turkish Thrace), and Greece between the Hebrus and Strymon, except for the coastal areas from the Danube to north of the Hellespont, and from Constantinople to Strymon in southwest Bulgaria. The territory was rich in fertile plains, forests, fish, precious metals, and iron and copper ores. The Thracians who are mentioned by Homer (*Iliad*, 6. 130, 9. 5, 14. 227, etc.; *Odyssey*, 8. 361) were agricultural tribes. Ancient writers give the names of many Thracian tribes: Tribali, Odrysae, Dardani, etc. They were a warlike, rural people, ruled over by various dynasties. The king of Odrysae was the dominant figure in the Classical period, until Philip II of Macedon invaded Thrace in the 4th century BC and established various cities including Philippopolis (Plovdiv). After the death of Alexander the Great in 323 BC Thrace fell to Lysimachus.

Greek colonies were established on the shores of Pontic Thrace from the end of the 7th century BC (Apollonia Pontica, Mesembria, Odessus) and from the middle of the 7th century BC in Aegean Thrace (Abdera, Maroneia, Aenus, Perinthus). Orpheus, the mythical singer, son of Apollo and a Muse, is generally called a Thracian and Thrace was considered to be his home. His grave and cult belong not to Thrace but to Pierian Macedonia, northeast of Mount Olympus, a region that the Thracians had once inhabited. Orpheus' song had superhuman powers and an important consequence of his miraculous song was his creation of Orphic poetry. The image of Orpheus was very popular in Greek and Roman art. In Attic vase painting he was represented in oriental as well as Greek costume. Several vases show him being killed by Thracian women.

The close links between Greece and Thrace are demonstrated not only by the depiction of Thracians in Attic vase painting but also by the introduction of the cult of the Thracian goddess Bendis to Athens in the 5th century BC. Greek artists represented her as a booted huntress, like Artemis. A priestess was assigned to her by one of the decrees of 413/12 BC and a great festival was established in Piraeus, at which twin processions of native Thracians and Athenians were followed by a torch race on horseback, and celebrations continued all through the night.

Thracian religion is a much-debated subject. The information given by ancient writers, especially Greeks, presents the Greek interpretation of local religious beliefs. Herodotus (5.7) states that the Thracians worshipped Ares, Dionysus, Artemis, and Hermes. The similarities between the worship of a Great Goddess and the cult of Artemis in Asia Minor or of Cybele are obvious. The idea of heroization was restricted to members of the nobility and royal family. The existence of a cult of Helios is attested not only in Greek literature (Sophocles, *Tereus*, fr. 582) but by archaeological and numismatic data. The most popular cult was that of the so-called Thracian Rider, represented by about 2500 votive stone monuments, often of the rider hunting.

Little is known about Thracian culture of the Archaic period. We have much more evidence from the period of the establishment of the Odrysian kingdom in the 5th century BC, although our knowledge of Thracian culture is confined to that of the ruling elite. The Thracians were very advanced metalworkers, and many metal objects made of gold or silver, especially drinking vessels, are known from the tombs of local rulers and nobles; Greek and Achaemenid or Achaemenid-type vessels are also known. Stylistically, there is a mixture of Greek, Achaemenid, and local elements. The quantity of vessels and pieces of jewellery found in tombs is quite impressive. The information provided by Thucydides (2. 37) concerning gift giving and tribute

collected from Greek cities and from “all the barbarous nations” in the reign of Seuthes (424–c.408 BC), the king of the Odrysae, makes it clear that the Odrysian kingdom was similar to the Achaemenid empire in that the king exploited Greek craftsmen to create his culture. Excavation of the settlement at Vetren, in the Thracian hinterland not far from Plovdiv, shows that this practice began in Thrace in the mid-5th century BC. This settlement, the residence of the local ruler, was built entirely by Greek architects and masons, as the planning and layout, paved streets, and, most importantly, city-gate and fortification system demonstrate.

Greek influence on local elite culture was strong. The nobility used the Greek alphabet, as seen on a ring and vessels from the Rogozen Treasure (now in the National History Museum, Sofia). In the Hellenistic period the Greeks became even more heavily involved; for example, the town planning and architecture of Seuthopolis (which had an agora), as well as its fortifications, are examples of Greek craftsmanship and masonry, as in Vetren. Inscriptions, legends on coins, and stamps and graffiti on Thracian pottery all indicate that the Greek language was very much used in Seuthopolis. In this royal city, built and decorated entirely by Greeks, temples as well as Thracian clay altars were found. The religion shows very strong Greek influence. Another royal city, Cabyle, archaeologically less well known, has an inscription in ancient Greek which is identical to that found in Seuthopolis. The Getic capital at Sboryanovo, which has been studied since the late 1980s, has also revealed a stone fortification system, stone architecture, and inscriptions in Greek.

Greek masons were further employed to build and decorate tombs. In the chamber of the barrel-vaulted tomb at Sveshtari a Doric entablature is supported on the raised hands of women, with the help of five Corinthian half-columns: this is redolent of Greek caryatids. There are impressive murals in a tomb at Kazanluk: chariot races, a Greek decorative frieze of bowls and bucrania, and figures approaching the dead prince and his consort seated at a table. All the trappings and furniture are Greek. Since the 1980s excavations in the Shipka area have brought to light several dozen rich tombs, some decorated with very impressive murals.

Roman involvement arose from Thrace's links with Macedonia. After the Macedonian revolt of 149 BC (in which Thrace was heavily involved) was put down, Rome aimed to stabilize the area by establishing client kings in Thrace. These continued until AD 46 when the country was annexed and made into a province. It became one of the most important Danubian provinces of the Roman empire, and protected the lines of communication from Macedonia to Bithynia and Asia Minor via Byzantium. Barbarian ravaging of Thrace, which began

with the Goths passing through in a swathe of destruction, continued in the 4th and 5th centuries AD.

Thucydides

Athenian historian of the 5th century BC

Thucydides was a member of an Athenian aristocratic family which owned gold mines in Thrace and was connected at least by friendship, possibly also by marriage, with the local Thracian aristocracy. In 424 BC, during the Peloponnesian War between the Athenian empire and the alliance headed by Sparta, he held an amphibious command on the Thracian coast, but went into exile in consequence of his failure to prevent the Spartan capture of a strategically valuable city. He returned to Athens in 404 BC, when all the exiles were recalled, and died probably about 395 BC.

According to his own account, when the Peloponnesian War began in 431 BC he decided to write its history. This ambition was not completely realized, because his work, which survives, ends abruptly in the winter of 411 BC, though passages elsewhere refer clearly to the end of the war in its 27th year. His account (book 8) of the 20th and 21st years differs in character from books 1–7, and may represent a stage intermediate between a first draft and a final version. Histories of the last six years of the war were written by others in the 4th century BC.

Thucydides was not the first major Greek historian, for Herodotus' history of the Persian invasion of Greece appeared a generation earlier, but he was nevertheless a pioneer who did much to shape the form and nature of subsequent historiography. In particular, he put speeches, condensed in language and thought, into the mouths of his personages on critical or otherwise memorable occasions. The most famous has long been the funeral speech of his Pericles in book 2, at the burial of the war dead of 431 BC. The speeches are sophisticated in language and replete with moral, political, and psychological generalizations. There are, of course, abundant speeches in Homeric epic, and quite a number in Herodotus, but Thucydides is peculiar in that he had been present on some of the occasions which he adorns with speeches, and could have learned much about the rest from contemporaries. Aware of the role of the spoken word in determining the decisions of the Greek city states, in his preface he divides the content of his work into "what was said" and "what was done", and claims that he had recourse to inventing what speakers "needed" to say only when he could not recall or discover what they actually said. The extent to which this claim is compatible with what we read in his text (in books 1–3 speeches amount to nearly a third of the whole) is a focus of controversy which is likely to continue. Whatever his own intention, he unwittingly set a bad example to later historians, Greek and Roman alike, who, writing for a culture devoted to the art of oratory, assumed the right to invent speeches.

In narrative his style is usually simpler than in speeches, and sometimes vivid and dramatic, but his generalized descriptions of situations (for example, the moral effects of the plague in book 2 and the disastrous spread of civil strife in book 3) are hard going. He experiments with syntax, deploys a stock of unusual abstract nouns (some probably coined by him), and often seems to be trying to convey too much in too few words. Our problems as readers might well be solved if we could hear him reading his own text aloud and could note his placing of stress and pause. Since ancient literary critics could no more do that than we can, they found him a difficult author and often disagreed over his meaning.

Such experimental language is one aspect of the tendency among intellectuals in his time to innovation and rejection of tradition. Save in one doubtful instance, he is sceptical about oracles, never attributes historical events to divine intervention, and gropes after scientific explanations of natural phenomena. In these respects he is much nearer to early medical writers than to Herodotus; indeed, he seems to have modelled his description of the plague on them, though differing from them in terminology. In a few articulate intellectuals the shift from a religious to a scientific world view generated the idea that the

good and admirable person is the one who (following the law of nature) imposes his will on others for his own self-aggrandizement. Thucydides certainly does not think that. The belief that he does, still widespread, is generated by the error of treating arguments put forward in this or that speech as if they were his own.

He is undeniably an impressive, magisterial writer, professing strong attachment to accuracy and adopting a detached view which only rarely wavers under pressure from his emotional reactions and predilections. A sombre tone manifest in some of his observations on human behaviour may also be inferred from some of his apparently “deadpan” statements, and this has given him, over the centuries, a reputation for integrity, profundity, and wisdom. He was extensively read and studied in Byzantium; Procopius in the 6th century ^{AD} borrowed whole passages, and in the 12th century, while the scholar Tzetzes was exasperated by Thucydides’ obscurity, Anna Komnene strewed her history with unusual Thucydidean expressions, thereby enlarging the gulf between classicizing language and the vernacular of her time. Thucydidean language and style (with some injections from Herodotus and Polybius) continued to serve as a model for Byzantine historiography; a notable example is the work of the emperor John VI Kantakouzenos in the 14th century. He was translated into Latin by Lorenzo Valla in 1452, and into English in 1628 by Thomas Hobbes, who idolized him, not least for his exposure of what Hobbes regarded as the follies of democracy.

In Greece, Neophytos Doukas prepared an edition of Thucydides with Latin translation, published in Vienna in 1805. Korais in his *Hellenic Library* ignored Thucydides, either because Doukas had got in first or because Thucydides was unedifying and insufficiently philosophical. The difficulty of the language came to be recognized as a serious obstacle to Thucydides’ attainment of the central place in educational curricula that his fame might seem to justify, and in 1920 the statesman Eleftherios Venizelos embarked on a translation into a somewhat literary demotic Greek, published posthumously in 1937. Venizelos believed (as Thucydides himself did, to judge from what he says in his preface) that constants in human behaviour are such that a careful and wise account of an ancient war abounds in political lessons which are still valid.

But is Thucydides “careful and wise”? Is he even a reliable authority on the details of his narrative? In the 20th century no other Greek author has been subject to so heavy a revisionist onslaught. A general decline in reverence reminds us that a gifted writer can profess devotion to truth and then compose a narrative that is largely fiction. Modern standards of historiography make us aware that a narrative such as Thucydides’ comprises many thousands of data, of which only

a very small fraction can be checked against other relevant evidence. On topographical matters he is sometimes wrong; and when what he says is irreconcilable with what is said by later historians patently drawing on independent sources, we cannot simply assume that he, the master, must be right. No later historians, of course, can be treated as “confirming” him, because they may be drawing on him. He virtually never reveals, let alone discusses, his sources, but expects us to trust him to have put the right questions to his informants and to have pursued them until he got what we would regard as adequate answers. He very often makes firm statements about the hopes, fears, plans, and ambitions of individuals, and it is a failure of historical curiosity on our part if we do not ask, “How did he know?” There is a certain arrogance in his declaration that he begins his history with an account of the causes of the war “so that no one need ever seek to discover how so great a war arose”; little did he know how much would be written in our time on precisely that question.

Historians are necessarily selective, for otherwise their task would never be done, but selection presupposes at least a tentative interpretation, no matter what may be added or subtracted in the definitive interpretation. Given massive evidence, it is easy to discern what underlies a particular historian’s selectivity, but our evidence for the Peloponnesian War is far from massive. The most interesting aspect of Thucydides’ selectivity is his allocation of space: four lines on the massacre at Scione, six pages for the dialogue between Athenian and Melian negotiators preceding the siege and eventual massacre at Melos. Selection apart, it is suspected that Thucydides on occasion went beyond mere exaggeration, beyond an illegitimate slide from “must have been” to “was”, and had recourse to fiction in order to assimilate his narrative to the theatrical unfolding of a Greek tragedy. The implausible role which he consistently assigns to pure chance in the account of the fighting at Pylos (in book 4) is notably vulnerable to this suspicion. However, the evidence that he embraced fiction on that occasion and may possibly have done so on others falls far short of proving that he had any intention of turning historical exposition systematically into myth. A chain of tragic events must necessarily resemble tragedy, and before denying Thucydides the status of historian we would need to discount the immense quantity of down-to-earth details which constitute by far the largest ingredient of his work.

Biography

Born to an aristocratic Athenian family which owned gold mines in Thrace, Thucydides

fought as a general in 424 BC. After a period of exile he returned to Athens in 404. His history of the Peloponnesian War survives but is incomplete, ending in 411. He died c.395 BC.

Timaeus

Historian of the 4th–3rd centuries BC

Timaeus of Tauromenium in Sicily, a Greek historian of the front rank, was born in the middle years of the 4th century BC and died in the late 260s BC in advanced old age. Naxos, the original home city of his family, was destroyed by Dionysius I of Syracuse in 403 BC. In 358 BC Timaeus' father Andromachus gathered together all the surviving Naxians and settled them at Tauromenium. There Timaeus was born and there he lived until the mid-310s BC when he was exiled by the tyrant Agathocles of Syracuse. He took refuge in Athens where he

spent the next 50 years, first studying under a former pupil of Isocrates, and subsequently researching and writing in that city's libraries, for which he was derided by Polybius as a pedant and an armchair historian par excellence. Possibly he died at Athens.

As a preliminary to his historical work he researched (at Olympia) and published a study of Olympic victors to which he appended, apparently in the form of tables, the corresponding sequences of Spartan kings and ephors, Athenian archons, and priestesses of Hera at Argos. Greek chronology at the time was a highly complex and bewildering affair that hampered the task of serious historians. Timaeus' system of reckoning by Olympiads, though by no means perfect, marked a definite advance and was a commendable effort to impose order on chaos. It was adopted by Polybius, who otherwise had no kind words for Timaeus. Though he lived and worked at Athens, like many another émigré, Timaeus' attention was constantly turned towards the country of his origins, his concern as a historian being the history and achievements of western Hellenism. His *Histories*, in 38 books, were a detailed study of the Greeks of the west, of Sicily in particular, from earliest times until the death of Agathocles in 289/88 BC. To this magnum opus he added a further composition that dealt with the wars in Italy against Rome of king Pyrrhus of Epirus, and which brought events in the west in general down to 264 BC. And this therefore became Polybius' starting point.

As one of the earliest and best of Hellenistic historians, Timaeus' work seems to have combined with some success the various strands and tendencies of Greek historical writing that had been developing since the late 6th century BC. Into a framework of straightforward political and military history (what Polybius called a "pragmatic" history) he incorporated much else of diverse nature, very much in the mould of Herodotus and Ephorus. On the other hand, the unwelcome tendency to dramatize, and indeed sensationalize, historical narratives by, for instance, emphasizing and developing further appropriately pathetic elements in a story, a characteristic of much Hellenistic historiography, appears to have been a feature of Timaeus too. Furthermore, his Sicilian background and experiences clearly conditioned his work and help to explain certain aspects of it that gained its author notoriety. One such aspect was the extreme hostility with which he dealt with the tyrannies of Dionysius I, Dionysius II, and Agathocles at Syracuse, which took up most of the 4th century BC, a most important period for western Hellenism. As Polybius and Diodorus Siculus pointed out, blinded by personal hatred Timaeus seriously distorted the record of history. The other side of the same coin, which Polybius likewise criticized as a falsification of history, was Timaeus' propensity, when the above tyrants and their associates

were not involved, to idealize Siceliots and their achievements.

Yet even when his personal feelings were not involved, Timaeus, it would seem, was far readier to censure than to praise, a trait that earned him the epithet (a play on his name) of “Epitimaeus”, meaning the “fault-finder”. He was not a respecter of persons, the greater writers and thinkers being criticized alongside persons of humbler accomplishers. The surviving fragments do not enable us to draw any firm conclusions as to his motives, but in some instances certainly a passion for accuracy appears responsible, as when he criticized Ephorus’ arithmetic. Diodorus has preserved for us the respective figures for Carthaginian armaments given by Ephorus and Timaeus and we see that in every instance Timaeus’ numbers are far more moderate and realistic. The merits of the *Histories*, therefore, outweighed the flaws and it is not surprising that such a detailed and readable account, one moreover set against a firm and lucid chronological framework of Olympiads, quickly established itself as the standard account of western Hellenism and the western Mediterranean in general, and so it remained for centuries. Undoubtedly a contributory factor here was what Timaeus said about Rome. He was not the first Greek historian to refer to Rome, but he was one of the first to appreciate the city’s significance and certainly the first to present a fairly detailed and connected account of Rome’s early steps on the international scene. As such he exerted considerable influence on Roman historiography.

Tinos

Island in the Aegean

The small island of Tinnos lies to the northwest of the main group of the Cyclades, with an almost equal distance separating it from Andros to the northwest and Mykonos to the southeast; it has an area of 60 sq km. The interior is hilly, with a major mountain formation, called Mount Tsiknia, rising to 713 m in the east of the island; where crops can be grown, often by means of terracing, it is mainly fertile. The silk grown here was the most prized throughout the Cyclades, and for several centuries in the post-Byzantine period it was exported to Italy and France where it was widely bought as a Tiniot speciality.

According to an early tradition, the island abounded with snakes, and due to this it was known as Ophioussa; by tradition, Poseidon sent storks to eliminate the snakes, and the grateful Tinians built a famous temple dedicated to him. In 480 BC Xerxes forced the islanders to serve in his navy in the war with Greece, but before the battle of Salamis one of their ships was able to desert and tell the Greeks of the Perisan plans. “For this reason the Tinians were inscribed upon the tripod at Delphi among those who overthrew the barbarians” (Herodotus, 8. 82). In 378 BC the islanders joined the Athenian confederation and fell under Macedonian control in 338 BC after the Battle of Chaeronea.

Tiryns

Bronze Age city in the Argolid

Tiryns is described by Homer as “wall-girt” and, in the catalogue of ships, it formed part of the realm of Diomedes, ruler of Argos. The north/south division of the Argive plain that this implies may now be justified on recently expanded evidence of the Bronze Age road system. In myth Tiryns was the seat of Eurystheus who inflicted the 12 labours on Heracles, and thus features in several of Pindar’s odes.

The site lies in the southeast of the Argive plain on an isolated limestone knoll rising some 20 m above the surrounding area; it divides naturally into three sections known as the Oberburg, Mittelburg, and Unterburg. Geomorphological work indicates that in the Late Bronze Age the sea lay only 1 km from the foot of the knoll. Tiryns may thus have been the main port for the Argolid at a period when boats were beached rather than moored or anchored. In the 12th century ^{BC} the settlement extended widely around the site. Lack of evidence for this feature from earlier periods is thought to be the result of deep deposition from a flash flood that buried the settlement under alluvium. To prevent further inundation an extensive barrage was built higher up the valley to divert the torrent into another streambed. A hill to the southeast has two tholos tombs built into the west face and a series of chamber tombs (15 fully excavated) on the east. Further cemeteries for the 15th to 12th centuries ^{BC} remain to be found.

Excavation was begun in 1831 by Friedrich Thiersch and Alexander Rizos Rangabé and continued by Heinrich Schliemann in 1876. From 1884 Schliemann with Wilhelm Dörpfeld carried out a systematic exploration for the Deutsches Archologisches Institut, which continued at intervals until 1929. Restoration of the walls was initiated by the Greek Archaeological Service in the late 1950s and led to discoveries requiring further excavation. In 1965 the DAI resumed its work under the direction of Klaus Kilian; the work of publication and clarification continues despite his early death.

Settlement on the site dates back to the Neolithic period (5th millennium ^{BC}) but the earliest architectural remains of importance belong to the Early Helladic period. A round building was built on the top of the citadel; it is considered to be one of the series of large monumental buildings built for public or elite use in the EH II period (early 3rd millennium ^{BC}) but is the only one of this particular type known to date.

The site was continuously occupied but there are only scattered remains of structures before the Mycenaean period. Then a series of major buildings, usually known as palaces, were constructed on the Oberburg and fortifications of Cyclopean type built around each of the three sections of the site. Several features are particularly notable. A room floored with a single slab of limestone is identified as a bathroom. The so-called galleries are passages that led to storerooms, all corbel-vaulted and built within the thickness of the fortification walls. A similar passage, this time curving, led through a bastion to a small west gate. On the west side of the Unterburg two similar passages led through the wall and underground at a distance of c.30 m to sumps where water collected, thus affording an emergency supply

of water approachable only from within the walls.

In post-Mycenaean times, probably in the Geometric period, the central megaron was divided and a small temple created. This was dedicated to Hera. To the same period may be assigned the final square phase of an altar in the inner courtyard. Well-equipped tombs of the Protogeometric and Geometric periods have been excavated from immediately south of the citadel. A notable find has been identified as a helmet of Protogeometric date. To the Archaic period can be assigned a group of unique votive offerings including terracotta shields painted with scenes of warfare and gorgon masks as well as many more usual small terracotta figures of women. Also of the Archaic period are inscriptions carved on the upper outer face of the stones that roofed the passages leading to the underground water supply. These indicate that the partially destroyed wall was used at this point as seating for the population in an assembly. Tiryns joined with Mycenae in sending troops to fight the Persians at Platea in 479 BC, and a decade later suffered a similar destruction at the hands of the Argives. The population is said to have migrated to Haleis (modern Porto Cheli) at the southern end of the Argive peninsula, where numismatic evidence supports the claim.

Strabo describes Tiryns in terms similar to those he uses for Mycenae, as a site once famous and now without significant habitation. Pausanias mentions only the walls. In Roman times an olive press was constructed inside Tholos I. A small Middle Byzantine church was built over the inner side of the outer wall at the south of the Oberburg. Around it were several graves. Both church and graves as well as a threshing floor that had been built above them were removed in excavation to reveal the Mycenaean site.

Tourism

Tourism, in the sense of travel undertaken for pleasure, was probably not a common feature of ancient Greece, or in fact of the ancient world as a whole, where the conditions of travel must generally have been far from pleasant. Poor and dangerous roads, uncomfortable inns, expensive and inconvenient transport, and rampant piracy must all have contributed to discourage travel as a pastime.

Ancient travellers, however, the wealthy ones in particular, shared many of the objectives of tourism as we know it today: rest, recreation and relaxation, education, religious, cultural, and aesthetic experience, sports, food, shopping, and social contact. They may have retreated to the mountains or the seaside in summer to get away from the congestion or the boredom of the city, as suggested, for instance, by Lucretius (*De Rerum Natura*, 3. 1301–1318). Others probably visited curative thermal spas in search of relief from ill health. In the absence of diplomatic establishments, they relied on guest-friendships between families of different regions.

Although mass tourism is a relatively modern phenomenon, travellers throughout the ages have reacted as tourists, whatever the original purpose of their journeys may have been. From early times seaborne trade, in particular, was closely associated with sightseeing, even though the Greeks, at least those of the Homeric epics, did not show much enthusiasm for seagoing. Yet Odysseus, the ancient traveller par excellence, was admired as one who had seen many cities and visited many nations. Roman country estates and watering places and medieval centres of religious pilgrimage no doubt represent the small beginnings of a tourist industry. Some of the spas frequented by the Romans attracted pleasure seekers as centres of luxury, gambling, and high living. Due to its prestige as a cultural centre Athens, even after losing political importance, continued to attract Romans with pretensions to learning. The Greek and latin graffiti on pharaonic monuments and the papyrus (*Tebtunis Papyri*, 1902–38, 1. 33, p. 58 in Bagnall and Derow's edition) detailing instructions to prepare for a Roman senator's visit to the Fayum prove that in Roman Egypt sightseeing had come into its own. Memphis and the Fayum, Thebes, and the Valley of the Kings were popular destinations. On the Nile the Ptolemies employed great luxurious houseboats known as *thalamegi*. With the growing popularity of Panhellenic sanctuaries and the growth of academically prestigious centres, travel for spiritual and intellectual purposes must have become more common; in any case, sightseeing received monumental conceptualization in the idea of the seven wonders of the world. These consisted of the greatest achievements of ancient technology, architecture, and art known to Greek and Roman writers, which were visited during the Hellenistic age and remained the most famous attractions of the Roman world.

The list first appeared around 130 BC in a poem by Antipater of Sidon included in the *Greek Anthology*, and a treatise on the subject (probably from the time of the Roman empire) has been attributed to the engineer Philo of Byzantium (fl. 146 BC). The canon originally consisted of the pyramids of Giza in Egypt, the city walls of Babylon, the hanging gardens of Babylon, the temple of Artemis at Ephesus, the statue of Zeus at Olympia, the Mausoleum at Hallicarnassus, and the colossus of Rhodes. Listings from Pliny's time onwards generally substitute the Pharos lighthouse at Alexandria for the city walls of Babylon.

One of the earliest Greeks known to have gone abroad (at least ostensibly) for the purpose of seeing the world was the Athenian statesman and poet Solon (c.640–c.558 BC). Although he belonged to an aristocratic family, he was poor in his young days and travelled as a merchant to enrich himself. But after promulgating his laws he travelled to Egypt and Lydia as a tourist (Herodotus, 1. 30). Herodotus (c.480–c.425 BC) himself travelled widely in order to gather material for his *Histories*. He was intrigued by the customs of Egypt, where nothing was done as in Greece. His theme was the conflict between the Greeks and the Persians, and he personally visited many of the regions that made up the Persian empire. He was preceded in this respect by the geographer Hecataeus of Miletus (fl. c.500 BC) who compiled a book entitled *Journey round the World (Periodos Ges)*, a sort of itinerary, based partly on his own travels, in which he described countries, their inhabitants and customs, animals, and curiosities, and included local fables. A map (which may have been an improvement on an earlier one by Anaximenes) was appended to it. The authenticity of this book, which survives only in fragments, has sometimes been questioned, but is now generally accepted. Fragmentary also is the descriptive work *On the Cities in Greece* by Heraclides Criticus of the 3rd century BC (ed. F. Pfister, 1951). The Roman elite, and above all emperors, pursued travel as a pastime. Hadrian (AD 117–38), a Hellenist who spoke Greek better than Latin, travelled in all the provinces, and built at Tivoli near Rome a vast villa in which the finest buildings he had seen on his travels were reproduced on a small scale.

The only work of ancient travel literature that has come down to us in its entirety is the *Description of Greece (Hellados Periegesis)* of Pausanias who, in the middle of the 2nd century AD, travelled throughout the Greek mainland visiting the principal cities (including Athens) and religious sanctuaries such as Olympia and Delphi. His work is a guidebook for tourists, in which he describes in succession various parts of Greece, and he enumerates their most worthy possessions including statues, pictures, tombs, and sanctuaries, giving

their etymology, narrating anecdotes, legends, and historical episodes. He related in detail what he saw, and his book is particularly valuable for information about Classical works of art and buildings no longer extant. He also provides much information about customs, religion, and social life in Greece under the Roman empire. He mentions rivers, roads, and villages, curious customs and superstitions, but references to scenery and natural products are rare, and he shows little interest in economic aspects of the country or in its inhabitants.

The extirpation of piracy by Pompey and Augustus and the unification of the Roman empire by the latter gave greater security to travel, though it was still vulnerable to weather conditions, the menace of robbers and brigands, and the many discomforts of ancient transport. The development of travel necessitated the growth of infrastructure, which in its turn encouraged voluntary travel by the provision of support in the form of inns, eating places, etc., though the elite often preferred to rely on reciprocal hospitality. Travelling for pleasure was no doubt enhanced by geographical writing which grew in parallel with mobility in general.

Town Planning

In the Neolithic settlement of Chirokitia on Cyprus (c.5500 BC) we encounter one of the first examples of a street. It runs uphill from the bank of the Maroniou river, crosses the settlement, and descends on the opposite side. In modernday Athens archaeologists can trace the path of ancient roads under some of the paved streets. Clearly streets are among the earliest signs of town-planning efforts, underscoring the element of continuity in human settlements. Our experience of the

urban environment, however, is not limited to the street layout and its two-dimensional representation on a map. Towns also gain their character from their governing institutions, their civic and religious buildings, their residential quarters, their open spaces, the goods they produce and trade, and their relationship to the surrounding regions.

The plan of ancient Athens, one of the best-studied cities of antiquity, was largely consolidated in the 6th century BC. At that time the Acropolis, once a defensive fort, became dedicated to the deities, and the first administrative buildings were erected in the Agora, the city's political and social centre. By the end of the 6th century BC the Agora defined a quadrilateral area, bounded by magnificent buildings. Other public works were carried out throughout the city, including water and sewer networks. A new road system was established, originating from the Agora. Outside the city there existed three gymnasia, for the military, athletic, and academic training, respectively, of the male youth. Urban legislation, dating also from the 6th century BC, forbade burials inside the city and controlled new building, while the city architect was charged with the maintenance of temples and other public structures. There was, therefore, an already established town-planning tradition that dictated the city's urban affairs, even though the street network remained irregular – "Attic", as it was often called – following closely the site's topography, rather than a prescribed orthogonal geometry. After the destruction of Athens by the Persians in 480 BC the Athenians could have redesigned their city in a regular manner. Instead, they adhered to tradition and rebuilt it along the same lines, this time surrounding it by a new set of walls. The Persians were finally defeated in 479 BC and the Athenian statesman Pericles marked this victory by initiating a completely new building programme on the Acropolis, with the erection of the Parthenon (447–432 BC), the Erechtheum (421–405 BC), and the temple to Athena Nike (427–424 BC), all dedicated to the goddess Athena.

Unlike Athens, the city of Miletus in Asia Minor, which was also destroyed by the Persians, was rebuilt in 479 BC following a regular plan of orthogonal blocks. Possibly the earlier settlement there was also regular. One of its residents, Hippodamus, who was fairly young at the time, might have participated in the city's rebuilding. Later he undertook the design of Piraeus (c.460 BC), Thurii in southern Italy (444–43 BC), and, allegedly, of Rhodes in 408–407 BC. In 432 BC the city of Olynthus in Chalcidice was laid out according to the Hippodamian manner. Its grid of parallel and perpendicular streets defined mostly identical building blocks, with some variations among the individual property lots.

Hippodamus is the only architect and planner whose name has come down to us from Greek antiquity. He certainly did not invent

regular, orthogonal planning, since there are several earlier examples of regularly planned settlements from around the world. Greek colonial settlements in southern Italy and Asia Minor also adhered to regular, orthogonal planning. According to Aristotle:

he was the first who, not being actually engaged in the management of public affairs, set himself to inquire what sort of government was best; and he planned a city state, consisting of 10,000 persons, divided into three parts, one consisting of artisans, another of husbandmen, and the third of soldiers; he also divided the lands into three parts, and allotted one to sacred purposes, another to the public, and the third to individuals. (Politics, 2. 8)

Hippodamus was one of the first urban theorists and philosophers to reflect on the relationship between a society and its urban environment. His legacy has been associated primarily with regularly planned cities, made up of streets that follow an orthogonal grid.

According to Plutarch, Alexander the Great founded approximately 70 new cities. After his death his successors continued to establish numerous new cities in northern Greece, Egypt, Asia Minor, and Anatolia. They all followed the regular, Hippodamian plan, the simplicity of which facilitated expeditious settlement and land allocation. Thessalonica, an important Hellenistic centre, was founded by Cassander in 316 BC, and laid out in orthogonal building blocks measuring 100 × 50 m. Two major east–west roads, on the site of modern Agiou Dimitriou and Egnatia Streets, traversed the city and led to the city gates. Open public areas contained the ancient agora, a sacred precinct, a stadium, a gymnasium, and a Serapeum. The modern city was redesigned after a catastrophic fire in 1917, but a careful examination of the pre-1917 plan allows us to recognize the Hellenistic grid that ordered it originally. Other prominent Hellenistic cities included Alexandria in Egypt, Pergamum and Priene in Asia Minor, and Damascus, Palmyra, and Dura Europus in modern Syria.

We can also gather significant information on the town planning practices of the Hellenistic period from *De Architectura*, the only surviving architectural treatise from antiquity. Written by the Roman architect Vitruvius (c.90–c.20 BC), it makes reference to famous Greek architects and their building methods. Vitruvius outlined site considerations for a new city: healthy location, moderate climate, protection from hot winds, and examination of the animals living on the site. “I cannot too strongly insist upon the need of a return to the method of old times”, he wrote. “Our ancestors, when about to build a town or an army post, sacrificed some of the cattle that were wont to feed on the site proposed and examined their livers” (*De Architectura*,

1. 4).

After Greece became a Roman province in 146 BC, some of its cities became the beneficiaries of imperial building programmes, while others fell into oblivion. In Athens under Julius Caesar and Augustus the Roman Agora and the Library of Hadrian – both structures located east of the ancient Greek Agora – were erected. Hadrian, the philosopher-emperor (ad 117–38), endowed Athens with a number of buildings and laid the foundations for a new city, Hadrianopolis, on the site of the modern National Garden, Zappeion, and Constitution Square. As a sign of gratitude, the Athenians erected a dedicatory triumphal arch that marked the city of Theseus, on one side, and the city of Hadrian, on the other side. Roman town planning was also based on an orthogonal grid, punctuated by the *cardo* and *decumanus*, the two main streets meeting at right angles at the Roman forum. Thessalonica, which retained its Hellenistic grid, enjoyed a building boom in the years of the Antonines (end of the 2nd century AD), as is evident from the Roman forum, the stoa of the Incantadas, the exedra, and other epigraphic evidence. Also significant is the imperial complex of Galerius Maximianus, built around AD 305, in the southeastern part of the Roman city. It consists of the Rotunda, the arch of Galerius, the palace, the octagon building, and the hippodrome. The north–south axis of the complex follows the orientation of the already established street network.

Trade

The earliest evidence for some kind of formal trade (both national and international) comes from the Bronze Age, when the Minoans and the Mycenaeans were interacting with Asia Minor, Cyprus, the Levant, Egypt, and Italy. This is mainly attested by several exotic materials

found on Crete and the Greek mainland and by Aegean pottery found in the areas mentioned above. In addition, there are numerous references in Egyptian 18th-Dynasty sources to “Keftiu”, which appears to be the equivalent of Caphtor and to be associated with Crete and the Aegean. Whether these exchanges were palace-administered or “free-enterprise” is not easy to say. The Linear B tablets (in the Mycenaean script) do not even mention the word “trade” but the shipwrecks of Ulu Burun and Cape Gelidonya (off the Turkish coast) indicate that some sort of free entrepreneurs were “tramping” from port to port, making various goods available to Greeks, Cypriots, Syrio-Palestinians, and Egyptians. Both the Minoans and the Mycenaeans mainly imported luxury goods such as gold, ivory, ostrich eggs, and lapis lazuli, but also copper, which was very important for them.

After the fall of the Mycenaean civilization around 1200 BC these exchanges did not cease completely, but became less organized than previously. The period from 1200 to 800 BC, which is widely known as the Greek Dark Ages, is considered as a time of poverty, isolation, and illiteracy. One would therefore expect a complete breakdown of such exchanges. The sites of Lefkandi in Euboea and Knossos in Crete, however, have yielded large numbers of high-value Near Eastern imports such as gold jewellery and ivory objects, indicating frequent contacts with the eastern Mediterranean.

It is not a coincidence that the Euboeans were the first Greeks to establish colonies in the west (such as Pithekoussai) and to participate in the development of multinational emporia in the east (Al Mina) during the 8th century BC. The commodities most sought after in the west were metals – iron, copper, and tin. Soon other Greek cities, such as Corinth, Rhodes, and Chios, founded colonies in the west (mainly in southern Italy and Sicily). These colonies, although politically independent, still kept close trade links with their mother city.

By 600 BC Greek trade was flourishing, mainly due to the establishment of permanent trading posts in Egypt (Naucratis), the Levant, and Etruria. In Greece some of the most important trading cities were Corinth, Megara, and the island of Aegina. It was during this time that Athens started to develop as a major commercial centre. The distribution of black-figure ware is the clearest indication of the growth of Athenian trade. In the period 560–520 BC Attic pottery reached most of the Aegean islands, Asia Minor, Cyprus, the coasts of the Black Sea, Egypt, southern Italy, Sicily, and southern France. The most important Athenian import was corn.

The conquest of the east by Alexander the Great in the 4th century BC widened the field of operation open to Greek trade. His successors carried exploration even further and we see, for example, the

Seleucids securing the route to India and the Ptolemies encouraging the development of the trade route around southern Arabia. The most traded goods were grain from Egypt and the Crimea, silk from China, gold from Nubia, silver from Asia Minor and Iberia, wine from north Syria, and slaves. Most of our information about trade patterns during the Hellenistic period comes from the distribution of large pottery containers known as amphorae which survive in huge numbers and whose handles used to be stamped with a state's symbol. Many of them are Rhodian and are found in Alexandria. From this we can infer that Rhodes was a major exporter of liquids, with Alexandria being a major recipient.

By the 2nd century BC Delos had become one of the most important commercial centres, especially after 166 BC when the Romans made it a free port. Unfortunately, the most traded commodity was slaves, something that attracted large numbers of Roman businessmen there. It is said that tens of thousands of slaves could pass through Delos in a single day.

Tragedy

Greek tragedy matured in Attica in the 5th century BC. With one possible exception, all of the surviving plays date from this time and were written by Athenians for competitive performance at dramatic festivals, notably the City (or Great) Dionysia (from at least the end of the 6th century BC) and the Lenaea (from the 430s BC). There were also performances at the Rural Dionysia. Productions were not confined to Attica and there are traditions that earlier forms of tragedy originated in the northern Peloponnese. The main festivals were important civic and political occasions with a strong religious framework expressed in sacrifice, ritual, and processions. There were performances of dithyramb and comedy as well as tragedy. The tragedy competition was part of the Athenian culture of public display, also evidenced in the gymnasium, law courts, and Assembly. Each contestant entered a trilogy followed by a satyr play. Judges were selected by lot from

across the tribes and their votes were delivered by secret ballot. Victories were listed in public records (*didaskalia*). These records, although fragmentary, help with dating.

The origins of tragedy are somewhat obscure. Aristotle (*Poetics*) put forward an analysis that has strongly influenced subsequent debate. He suggested that early tragedy was improvised by the leading performers of the dithyramb, a choral song and dance in honour of Dionysus, and that it was also influenced by the satyr play. Aristotle also gives an account of 5th-century BC developments affecting staging, the balance between choral and spoken words, and the increase in the number of actors from two to three. He emphasized the concept of the tragic hero and argued that tragedy inspired in the audience the emotions of pity (for suffering that was largely undeserved) and fear (because the hero represented the human condition). As a result, the audience would experience catharsis or relief of these emotions, tempered by a sense of satisfaction at recognizing and learning about moral and spiritual truths.

This combination of powerful emotions and the political context of popular democracy was thought by Plato to be dangerous. In the *Republic* he associated tragedy with his criticisms of poetry, especially Homer. Drama and poetry were to be banished from education in Plato's ideal state because he thought that they were concerned with representation rather than reality. He held that their appeal to the imagination and their portrayal of the extremes of divine and human behaviour were morally and politically subversive.

Greek tragedy is a prime example of the theatre of convention. These conventions cover staging, subject matter, and form. The main contextual conventions are that the plays were staged in large, open-air theatres as part of a performance culture embedded in civic and religious life. All actors were male. The City Dionysia had a tradition of competition by choruses. The financing of the chorus (including its maintenance and training) was undertaken as a liturgy (or public service) by a wealthy citizen, appointed by the eponymous archon who also chose the three tragedians who were to be "granted a chorus". The visual nature of the theatre spectacle, with its large audiences (perhaps in excess of 14,000 at the major festivals), had considerable impact on performance styles, especially masks, costume, gesture, and movement. The archaeological evidence for the orchestra, the part of the theatre where the chorus performed, between the stage and the audience, dates from the 4th-century BC theatre at Epidauros. In the 5th century BC the stage and its buildings (*skene*) were probably wooden with steps down to the orchestra. Stage machinery for tragedy included the *ekkyklema*, a wheeled platform for set-piece displays (such as Sophocles' Ajax surrounded by the carcasses of the animals

he had slaughtered in mistake for the Greek leaders). The *mechane*, a crane, enabled “flying” entrances and exits of the gods. Literary sources and vase paintings suggest that masks had stock features according to the character represented. Taken together, masks and the size of the theatre precluded the use of facial expression, thus putting more emphasis on grand gesture, costume, music, and choreography, as well as on the rhetorical force of the dialogue. Masks also facilitated the doubling of roles.

The subject matter of tragedy was also bound by conventions. With one exception all the surviving plays are based on stories from myth. These were part of the common culture of Greece, expressing values often shaped by the Homeric poems and transmitted by the rhapsodes’ performance of epic, particularized in vase painting and sculpture, and given local associations through cult. However, these myths, with their stories about the relationships between gods and heroes and their dilemmas of rivalry, revenge, murder, and betrayal in peace and war, were not presented by tragedians as fixed icons of the past. They were reworked and reinterpreted and, because of their indeterminate historical provenance, they provided a distanced but culturally influential setting for the exploration of suffering and the examination of moral and religious imperatives. The selection of particular myths and contrasts in the ways in which they were treated provide important insights into changes in attitude and artistic aims as well as a commentary on Greek perceptions of the relation of myth to the contemporary world and its problems. The surviving exception (others are lost) to the convention of mythological setting is Aeschylus’ *Persians* (472 BC), which depicts the aftermath to the Persian defeat by the Greeks at the Battle of Salamis, although the Persian setting maintains the remoteness from Athens that is a feature of most tragedy. A striking feature of tragedy, created in a society that subordinated and marginalized women, is that a significant proportion of the protagonists are female (e.g. Antigone, Medea, Hecuba) and that issues of gender and power are presented from a variety of perspectives.

The formal conventions within which the plays were constructed also served to distance tragedy from over-ready identification with everyday life. Of these conventions, the most important are the chorus, the various types of verbal exchange, and the lament. The chorus consisted of 12 or 15 singers and dancers who performed in the orchestra, providing for the audience a collective mediation of the moral and religious implications of the action of the tragedy. Their entry song (*parados*) was supplemented by lyric exchanges with the actors and by the choral ode (*stasimon*). Reconstruction of the music and dance in tragedy is speculative and so presentation of the chorus

has been difficult for modern productions, especially those that take place in a commercial or studio theatre. There were normally five choral performances in a tragedy and the episodes between these were the focus of sung or spoken exchanges. These might include the narration, often in a messenger speech, of vital events, including violence, which by convention took place off stage. Even more important was the formal debate or *agon* between two main characters. This usually included the dramatic device of *stichomythia*, in which actors spoke alternate lines or pairs of lines. Conventionally, a sung lament (*kommos*) expressed the pent-up emotions produced by the dramatic tension and the suffering of the hero. The ways in which these formal conventions are refined or varied provide significant insights into the work of the different writers.

Major parts of the work of three 5th-century BC tragedians have been preserved, while others are represented only by fragments. Aeschylus has seven plays extant and records indicate that he gained 13 victories. Sophocles wrote more than 120 plays and won at least 20 victories, 18 of them at the City Dionysia. Seven plays survive. Euripides had a less consistent record, with four victories at the Dionysia. He wrote about 90 plays, of which 19 survive.

The reception and transmission of tragedy in antiquity from the 4th century BC onwards shaped the responses of later ages. Fifth-century plays were performed and read in the 4th, when there was legislation to prevent wholesale changes to the text. In 386 BC a competition for revivals was established at the City Dionysia, but the 4th century BC also included important new work, and tragedians such as Arcestratus, Astydamas, Carcinus, Chaeremon, and Theodectes are either mentioned by Aristotle or were themselves the subject of revivals in the 3rd century BC. The “family” archives of theatre practitioners were a significant means of preserving previously unperformed plays and an influential feature of the widespread demand for performance was the development of powerful guilds for actors (Craftsmen or Artists of Dionysus) with their own institutions and privileges.

Adding to the early demand for Athenian tragedy in Sicily and Macedonia, Alexander the Great’s policy of establishing Greek cities in the east both spread Hellenic culture and exposed it to the contributions of non-Greeks. At Alexandria in Egypt the process of canon formation intensified from the 3rd century BC onwards with the collection together of selected plays of Aeschylus, Sophocles, and Euripides and the addition of commentaries. Demand for the availability of texts for education may have helped to make this a self-replicating operation. Greek tragedy also entered the culture of the Roman Republic through the plays of Ennius, Accius, and Pacuvius. In

the 1st century AD Seneca's tragedies, nine of which survive, violently orchestrated the situations and some of the formal elements of the Greek corpus. Senecan tragedy strongly influenced Renaissance theatre, especially in Italy, France, and England.

Once the Roman empire was Christianized and the centre of power shifted to Byzantium, tragedy was again regarded as dangerous, because it was a pagan art form and part of a theatre culture that the Church regarded as obscene (since it involved cross-dressing) and blasphemous (since it invoked the name of Dionysus). State funding for the traditional dramatic festivals was withdrawn and drama exiled to the melange of popular events in the Hippodrome. The alternative to suppression was appropriation and some features of the language and rhetoric of tragedy were absorbed into political and religious life. There was, however, continued artistic interaction between the tradition of tragedy and new work. For example, an undated Byzantine tragedy *Christos Paschon* drew heavily on Euripides, particularly the *Bacchae*, in its exploration of the suffering of Christ.

Transhumance

Transhumance is a form of herding organized around the movement of livestock between lowland pastures in the winter and mountain pastures in the summer. Herding of this type is a recurring feature of Greek life because year-round maintenance of substantial numbers of animals in either the plains or the mountains of Greece is difficult. The plains must be avoided during the summer months because a nearly complete lack of rainfall makes it impossible to find forage. The mountains must be avoided during the winter months because deep snows and extreme cold make it impossible for flocks to graze. Greek transhumants, drawn by relatively abundant vegetation and mild temperatures, spend the months from October to April in various coastal plains. As summer approaches, they move to upland areas where melting snow produces rich forage. Greek transhumants rely almost exclusively on sheep and goats; the nimbleness and size of these animals make them much better suited to the rough topography of the country than cattle.

Transhumance can take one of two very different forms. In some cases it involves nothing more than individual shepherds migrating with their flocks. Typically such shepherds are employed by large landowners who provide the animals and grazing lands. In other cases transhumance is a form of societal organization in which large, independent family groups migrate with and organize their lives around the care of their flocks.

While the latter form of transhumance is the more common and probably the more ancient, the earliest documented instance of transhumance in Greece is an example of the former. During the Mycenaean period (c.1600–1100 BC) Greece was divided into a number of kingdoms, each with a ruler and an elaborate bureaucracy. These rulers controlled very large numbers of sheep that were assigned, flock by flock, to individual shepherds. In return for sustenance provided by the royal household, the shepherd was responsible for tending the animals assigned to him and for producing a specified amount of wool each year. Extant records indicate that the ruler of Crete owned 80,000 sheep which produced nearly 68,000 kg of wool each year.

This system of transhumance broke down with the collapse of Mycenaean civilization. The highly unsettled conditions that ensued were an ideal environment for group transhumance. The ability of transhumants to move out of the way of danger was an important aid to survival in a period of societal disintegration. In addition, the steep decline in population levels and in agricultural activity that marked the post-Mycenaean period made extensive areas of Greece newly available as pasture land. Animal bones from this period found at the site of Nichoria in the southwest Peloponnese show that the composition of herds differed from that found in the Mycenaean period in such a way as to increase the production of meat and milk and at the expense of wool production. This change reflects the transition from individual transhumants supported by the Mycenaean state to group transhumance and direct reliance on flocks for sustenance.

While the collapse of society and population levels encouraged transhumance in the years immediately after 1100 BC, the gradual restoration of society and rise in population levels that took place in the 8th and 7th centuries BC did the reverse. In settled conditions the advantages of mobility were considerably lessened. More importantly, the fact that herding, relative to agriculture, is a non-intensive land-use pattern that is capable of supporting a limited number of people meant that as population densities in Greece increased, so did the importance of agriculture. Even so, transhumance continued to be practised throughout antiquity. Sophocles' *Oedipus Tyrannus* (lines 1133–40), for instance, includes a scene involving two shepherds who spent summers with their flocks on Mount Cithaeron and then returned to lowland pastures in the winter.

Translation from Greek

Translations, together with adaptations and imitations, have been an important vehicle in the diffusion of Greek literature and thought. In certain instances, translations from the Greek represent the earliest examples of written literature. This is the case in particular with the Christian literature in Armenian and Georgian, where translations from Greek and Syriac played a formative role. Similarly, Roman literature is believed to have begun in 240 BC when a Greek schoolmaster named Livius Andronicus translated into Latin a tragedy, a comedy, and an epic, the last being the *Odyssey* which he rendered into Saturnian verse. New Comedy (and possibly Middle Comedy) provided the sources for the earliest literary comedies in Latin of which we have surviving examples by Plautus and Terence, on whose work we have to depend for our knowledge of many lost works by poets of New Comedy such as Philemon, Diphilus, and Menander. The plays of Seneca are the only surviving examples of Latin adaptations from the great Classical Greek tragedians. Latin poets did sometimes translate Greek lyrics, Catullus 51 being a well-known example; but no one today would wholeheartedly agree with Aulus Gellius who held that Virgil in his *Eclogues*, *Georgics*, and *Aeneid* translated Theocritus, Hesiod, and Homer respectively, his debt to these poets being best described as one of inspiration and imitation.

Most educated Romans were bilingual, and many of them endeavoured to make the literature and learning of the Greeks available to Romans by translation and adaptation of Greek works into Latin. Thus, Cicero translated the *Phaenomena* of Aratus, a Hellenistic didactic poem on astronomy (this work was translated once again in the 7th century). But the Romans, and especially their poets, were quite conscious of the limitations of the Latin language in matching the richness and subtlety of Greek (cf. the complaint of Lucretius in 1. 139 about the poverty of the language).

The Romans conceptualized the process of translation and established the framework and norms which endured in the west until the end of the 18th century. The younger Pliny (*Epistulae*, 8. 9. 1) recommends translation from Greek to Latin and vice versa as an exercise for developing verbal fluency and critical discernment. There was also advice against undue literalism. Horace (*Ars Poetica*, 133–34 tr. Dorsch) says:

A theme that is familiar can be made your own property as long as you do not waste your time on a hackneyed treatment; nor should you try to render your original word for word like a slavish translator, or in imitating another writer plunge yourself into difficulties from which shame, or the rules you have laid

down for yourself prevent you from extricating yourself.

On translating from Demosthenes and Aeschines, Cicero's advice is "not the words of the orators". "To explain not word by word but sense by sense", says St Jerome, who produced the Latin Bible known as the Vulgate.

During late antiquity translators into Latin concentrated mainly on science, military exploits, and adventures, and Christian works on theology, hagiography, and ecclesiastical history. Among scientific writings, the *Periegesis* of Dionysius was rendered into Latin by both Rufus Festus Avienus and Priscian. The gynaecological works of Soranus of Ephesus were translated by Mustio during the 6th century. The metrological treatise of Epiphanius of Salamis, written around AD 392, was translated in the 5th or 6th century. The alleged memoirs of Dares of Phrygia (6th century BC) and the story of Apollonius of Tyre are representative of military exploits and adventures. Translations of hagiography began quite early: Athanasius' *Life of St Antony* appeared in Latin as early as AD 373, and the story of *Barlaam and Joasaph* was translated into Latin during the 11th century.

Travel

Long-distance travel was widespread in all periods of Greek antiquity. Already in the *Odyssey* we encounter itinerant experts, including seers, physicians, builders, and bards, who, as Homer tells us (17. 386), were "invited from the ends of the earth". Questions such as "Who are you? Where do you come from? What is your city? Who are your parents?", which occur frequently in the *Odyssey*, no doubt reflect the realities of Homer's own world where travel for military or commercial purposes was commonplace. In later times sophists and – a much larger category – mercenaries travelled extensively. In addition, many individuals occasionally made long journeys, either to attend a distant festival or celebration of the games, consult an oracle, or visit a healing sanctuary. It is unlikely that anyone ever undertook a long journey purely for pleasure, however. The most widely travelled Greek in antiquity was probably Herodotus, who in the 5th century BC visited Babylon, the Black Sea region, Egypt, and Phoenicia while researching his historical account of the Persian Wars, which is also the world's first travel book. The only guidebook that has survived is Pausanias' *Description of Greece*, written c. AD 150, which

claims to describe “all things Greek”.

Since no part of the Greek mainland is more than 100 km from the coast and since safe harbours abound, the most common method of long-distance travel as well as of transportation was by sea. Owing to the frequency of storms in the Aegean, however, seafaring was regarded as a dangerous undertaking. As today, it was largely confined to the months from May to October. In the winter very few voyages were undertaken, except in the case of an emergency such as that resulting from a desperate food shortage. A further hazard was piracy, which was endemic throughout the Aegean from early times onwards. Passenger ships were unknown and those who wanted to take a sea voyage would generally have had to stand on the waterfront and request a place on a cargo ship that happened to be travelling in the right direction, if not to their actual destination. No food or bedding was provided on board, so passengers had to come supplied with their own. The perilousness and unpredictability of the sea is a central motif in the *Odyssey*, since it is due to the wrath of the sea god Poseidon that Odysseus, who is returning home to Ithaca at the end of the Trojan War, loses all his companions and is delayed for nine years. Poseidon's enmity reflects a genuine paranoia about sea travel, notwithstanding its importance.

From early times the sea played a vital part in shaping Greek history and in moulding the Greek character. There is evidence of settlement in several of the hundreds of islands dotted around the Aegean already in the Early Bronze Age. Homer's world extended from Sicily in the west to the Hellespont in the east. It was surely due to their familiarity with this element that seafaring Greeks came to develop a flexible response to the challenges of the outside world. Almost all the most important city states possessed seaports and those that were landlocked remained conservative. The dichotomy is exemplified by the difference in character between the Athenians and the Spartans, the dominant powers in the Classical era. Whereas Sparta, an inland state, was reactionary and unenterprising, Athens, whose might and wealth were based on the sea, was innovative and progressive.

None of Greece's rivers is navigable and only a few have estuaries wide enough to serve as ports. Hence travel on the mainland was generally by road or track. Owing to the unevenness of the terrain, this tended to be slow, arduous, and difficult. Most people travelled on foot with a slave or two to carry their baggage because horses were not capable of travelling long distances or of negotiating the steep mountain paths that often provided the only means of access from one community to another. Likewise chariots and other wheeled vehicles were useful only over short distances. The island of Ithaca, which is

described as “rugged and unfit for driving horses” (*Odyssey*, 13. 242), is typical of much of Greece and the suggestion that the road between Pylos and Sparta was sufficiently smooth to permit Telemachus to traverse it in a chariot is a sublime fantasy on Homer’s part (*Odyssey*, 3. 482–86). Even so, horses remained important status symbols throughout antiquity.

It follows that in all periods up until the present day Greeks would have been accustomed to walking considerable distances. Socrates in Xenophon’s *Memorabilia* (3. 13. 5) talks nonchalantly of undertaking a five to six days’ walk from Athens to Olympia. Even though the distance from Athens’ furthest demes to the capital is no more than 50 km, it is unlikely that its rural population would have regularly travelled to the city to attend meetings of the assembly, however. Probably women, the elderly, and the infirm hired wagons drawn by horses, mules, or oxen to convey them short distances, where the roads permitted. In later times a litter or sedan chair, known as a *phorelon*, was available to the wealthy.

The dangers of moving about in a world where no protection was offered to travellers gave rise to the image of the culture hero, whose task was to clear the roads of brigands and wild beasts. Examples include Theseus and Heracles. One of the brigands eliminated by Theseus was Sciron who, after robbing travellers, ordered them to wash his feet before kicking them over a cliff into a ravine below. Though we hear of highwaymen only occasionally, they must have presented a constant danger on land, as did pirates on the high seas. To safeguard the interests of their compatriots, many states appointed officials called *proxenoi* in foreign cities. *Proxenoi* were resident aliens who lived permanently abroad.

In times of emergency a city might call upon the services of a professional runner to bear a message to an ally. The stamina of such runners was prodigious. A famous example was the Athenian Pheidippides, who according to legend ran from Athens to Sparta – a distance of 240 km – to request military assistance against the Persians in 490 BC. Pheidippides then ran a similar distance to Marathon and followed up this feat by running to Athens, whereupon, after delivering his report of the Athenian victory, he expired. In the Hellenistic era the Greek kings took over the highly efficient network of roads and communications maintained by the Persians throughout their vast empire.

A number of Greek roads that were used in historical times had their origins in the Mycenaean period. Very few were paved, but the Greeks developed a number of sophisticated roadbuilding techniques. These included ramps, switchbacks, and pulloffs, for which there is evidence already in the archaic era. All roads, however, were local,

their purpose being to facilitate travel within a state's territory rather than to join communities to one another. Mule and drovers' tracks provided the only link between communities. It was common to bury the dead in family plots adjoining major roads, for which reason epitaphs frequently address the wayfarer.

Many sanctuaries were served by sacred ways, though these usually extended only a short distance. As Pausanias reports, however, even an international sanctuary like Delphi was difficult to approach on foot. The principal paved road in Athens was the Panathenaic Way, which began at the Dipylon Gate on the west side of the city and ended up on the Acropolis, barely 1.5 km away. A more functional paved road extended from the marble quarries on Mount Pentelikon to Athens. Goods were conveyed to and from the port of Piraeus along a paved cart road. During the Peloponnesian War, when it was no longer safe to travel outside the city, a road running the entire length of the Long Walls joining Athens to its port served in its place. The most impressive road-building project in Greece was the *diolkos* or slipway, which was constructed by the Corinthians in around 600 BC. The *diolkos* enabled ships to be towed across the isthmus of Corinth, rather than having to circumnavigate the Peloponnese. It remained in use until the 9th century AD.

Though Agamemnon supposedly conveyed his mighty army to Troy by sea, in historical times armies travelled to the theatre of war by land. Homer's warriors are usually conveyed to the battlefield in chariots, though they fight almost exclusively on foot. Their chariots remain parked while their owners engage, ready to provide a means of escape if their owners are forced to retreat or when they go off in search of a new opponent. Cavalry, though frequently mentioned in our sources, played a relatively minor part in Greek warfare.

In the absence of inns and hostelrys, aristocrats in the Archaic period operated a system known as guest-friendship or *xenia*. This facilitated long-distance travel by providing hospitality on a reciprocal basis. The guest-host relationship was judged to be so sacred that its supervision was placed under the protection of Zeus Xenios. Homer suggests that guest-friendship transcended what passed for national boundaries. In the *Iliad* (6. 230f.) the Greek Diomedes and the Trojan Glaucus refuse to fight against one another once they have discovered their parentage "so that everyone will realize that our families have provided hospitality for one another in days of old". Not until the 5th century BC do we hear of facilities offering accommodation for travellers. These remained basic throughout antiquity. Even in a major commercial centre like the Piraeus, accommodation was limited. Aristophanes (*Frogs*, 112–15) indicates that its inns had a reputation for discomfort and bedbugs. By the middle of the 5th century BC the

lack of decent facilities led Xenophon (*Revenues*, 3. 12) to recommend the construction of more facilities, though whether his advice was followed is not known. By the Roman period the situation seems to have deteriorated further. Cicero (*Letters to Friends*, 4. 12. 3) states that when a certain Servius Sulpicius journeyed to the Piraeus to collect the body of a friend, he found the latter stretched out under a tent, evidently because he had been unable to find more suitable accommodation in the port. Throughout antiquity the wealthy continued to find hospitality in one another's houses or brought tents and other gear in their entourage.

Under Roman rule the provinces of Macedonia in the north of Greece and Achaëa in the south became linked by an efficient network of roads like the rest of the empire, with Thessalonica, Athens, and Corinth representing the principal hubs. The most important road in the region was the Via Egnatia, which ran in an east–west direction through Thessalonica, parallel to the northern border of the empire. It was strategically important in the late Republic at the time of the Civil Wars but declined in military significance from the 1st century AD onwards when the frontier moved north to the river Danube. In this period, too, Roman tourists began to visit Athens and other major sites. The first guidebook on Greece, which was essentially limited to the province of Achaëa, was written by Pausanias (fl. AD 150).

Trebizond

City on the southeast coast of the Black Sea

Trebizond is the English name for the Greek Trapezous, modern Turkish Trabzon, a city in the Pontus, on the southeastern shore of the Black Sea. The port was a Greek colony, daughter of Sinope and granddaughter of Miletus, from the 7th century BC (its traditional foundation date of 753 BC is much too early). Historically Trebizond owes its importance to two factors. First, as Xenophon found as early as 400 BC, it is the political capital of a distinct and persistent local

identity, a combination of indigenous, especially Caucasian (including Laz), people and of Greek colonists and culture (Pontic Greek is one of the oldest spoken examples of the language). Second, Trebizond is the furthest port east through which European shipping could once reach an overland route that penetrates Central Asia. This combination of factors made Trebizond both a local provincial capital and, intermittently, a port of intercontinental strategic and commercial importance. The periods of the city's commercial importance (especially from 1258 to 1475 and from 1829 to 1869) coincided with its local autonomy (particularly under the Grand Komnenoi, emperors of Trebizond from 1204 to 1461) and with the patronage of most of its major monuments.

The city basically consists of two settlements, hemmed between the sea and Mount Minthrion (Boz Tepe). On the west is a naturally defensive site, wedged between two deep ravines that narrow to an acropolis 1 km inland, on which the Upper City bears the accumulated masonry of an administrative citadel and palace of the Grand Komnenoi. Below it the Middle City is dominated by the domed basilican cathedral of the Chrysokephalos, remodelled as a coronation church in the 13th century, now the Orta Hisar Camii and principal mosque of Trabzon. Trebizond was an episcopal see from the 3rd century AD and Justinian dedicated its aqueduct to St Eugenios, its patron martyr. The Lower City reaches the sea to embrace an artificial harbour, the Molos, plausibly attributed to the emperor Hadrian (AD 117–38).

The second settlement lies about 1 km east of the walled city and acropolis, around the commercial harbour of Daplnous. Trebizond appears to have lacked many of the conveniences of a Hellenistic city, such as a theatre, although the cathedral probably stands on the site of a temple. But the modern street plan that links the city with the eastern suburb reveals a Milesian or Hippodamian grid, such as in Sinope, Histria, and Cherson, of blocks of about 100 × 60 m, complete with a *cardo*, or main street. Four empty blocks suggest an agora, today the *meydan* or main square of Trabzon, around which all the Classical inscriptions have been found. This open space overlooking Daplnous is the oldest monument of Trebizond in continuous use; it became the supply base of the Roman campaign against Armenia in AD 58, from AD 64 of the legion XV Apollinaris, stationed at Satala (Sadak), of Justinian's 6th-century Laz and Persian wars, and of 9th- and 10th-century Byzantine campaigns on the eastern frontier, when Trebizond was capital of the theme of Chaldia. From the 13th century it became the ceremonial square of the Grand Komnenoi and assembly point of caravans going south. Venice and Genoa built their own castles on the seaward side – the latter, Leotokastron (now Güzel

Hisar), rivals that of their host emperors. The *cardo* (now Meras, Caddesi) remains the principal commercial quarter and bazaar of the city. The overland route to Tabriz, 32 staging posts away, reaching eventually to Central Asia, was already in decline after the break-up of the Mongol and Timurid empires before sultan Mehmet II conquered Trebizond in 1461. The *meydan* was reanimated after 1829, when western traders returned to exploit the overland route to Persia, but declined after 1869 when the Suez Canal offered a more convenient alternative. Trebizond is not a convenient port. Although Daphnous faces east, before the 20th century all goods had to be beached or taken ashore by double-ended lighters, including the first Ford motor car, rowed ashore in 1921. Until then pack animals assembled in the *meydan*; today the stables on its corner have been replaced by the garage of the Ulusoy Bus Company. Marco Polo was not the last to mislay his luggage on the square.

Trikkala

City in Thessaly

Trikkala has had a long and varied history. As Triikka or Trike it appears in the *Iliad* as the home of the sons of Asclepius, one of whom, Machaon, was the chief physician of the Greeks. There are signs of Mycenaean and early Iron Age settlements in the area. In Classical times the town did not figure very prominently, situated as it was in a remote part of Thessaly, itself on the periphery of the Hellenic world. It appears occasionally in inscriptions. There is a shrine to Asclepius in the area. In 352 BC it suffered during the war between the Phocians and Philip of Macedon. It played a part in the wars between Rome and Macedon and that between Caesar and Pompey, occupying a strategic position at the foot of the high Zygos pass that provides the only route between Epirus and Thessaly.

Trojan War

The Trojan war was a legendary expedition undertaken by the Mycenaean Greeks against the people of Troy, the modern Hisarlik which lies in northwest Asia Minor, 6.5 km from the Aegean coast. This military operation was made famous mainly through the *Iliad* and *Odyssey*, two epic poems attributed to the Archaic poet Homer.

Hisarlik's identification with the Homeric Troy has never been proved, but it is generally assumed that the legends relating the Trojan War also encompass elements of historical truth. It is plausible that the Mycenaean Greeks could have destroyed Troy between 1270 and 1190 BC; Troy VIIa – which lasted until 1190 BC – is considered by Garl Blegen to be the Homeric city, but others push the date of the sack back to c.1270 BC, the time that coincides with the peak of power of both Mycenaean Greece and Troy. According to Thucydides, the Achaeans' sack of Troy led to no permanent settlement in the Troad; instead the Greeks returned home with their plunder to face destructions connected with the Dorian invasion, which put an end to the Mycenaean period.

Neither the *Iliad* nor the *Odyssey* gives a comprehensive account of the events related to the Trojan War. The *Iliad* concentrates on only four days of fighting in the tenth and last year of the war and its major theme is Achilles' anger over Briseis, who was given to him as booty and subsequently taken away from him by Agamemnon. The *Odyssey* includes consecutive flashbacks of Odysseus' adventurous trip home, and its second half is devoted to Odysseus' cunning restoration of order in Ithaca.

Several other aspects of these events were covered by the cyclic epics, subsequent hexameter poems reproducing the repertoire of the oral bards and indicative of the heroic poetry before Homer. Among them, the *Cypria* narrates the causes of the Trojan War, the judgement of Paris, the abduction of Helen, and the gathering of the Greeks in Aulis; the *Aethiopis* recounts the story of Amazon Penthesileia and the death of Achilles; the *Sack of Ilium* deals with events connected with the Greek victory such as the ruse of the wooden horse and the deaths of Priam and Astyanax; the *Telegonia* narrates the later adventures and the death of Odysseus.

The Trojan War is widely represented on Greek vases, sculpture, and architecture. Among the earliest Archaic representations of scenes

from the Trojan War are the wooden horse on the 7th-century pithos of Mykonos (still in situ), the pediments of the temple of Aphaia Athena in Aegina, and several black-figure vases from Athens and elsewhere. Famous later representations include the metopes from the north side of the Parthenon and the temple of Asclepius in Epidaurus.

Subsequent Greek literature gives centre stage to the Trojan War. Both Herodotus and Thucydides attempt to provide rational accounts of the war, but Stesichorus' famous *Palinode* and Sappho's ode to Helen's passion for Paris (fr. 16 L-P) are indicative samples of the poets' early fascination with the legendary beauty of the queen of Sparta. Helen, the dehumanizing power of the war, and the ambiguities of military heroism are also some of the main themes developed further in the Athenian tragedies of the 5th century BC. Famous among those surviving are Aeschylus' *Agamemnon*, Sophocles' *Philoctetes*, and Euripides' *Hecuba*, *Andromache*, *Troades*, and *Iphigeneia in Aulis*. In post-Classical times *Hecuba* was one of the three tragic plays of the Byzantine academic canon. In early modern times the earliest attempts at the revival of tragedy include P. Katsaitis' *Tragedy of Iphigeneia* (1720) and Metastasio's *Achilles en Skyro* from the period of the Greek Enlightenment (1774).

Tyranny

The word "tyranny" was almost certainly Lydian in origin. From its first use in Greek – in a fragmentary poem of the 7th century BC by Archilochus of Paros – it was associated with the kingdoms of the Near East. The speaker in Archilochus' poem denies any ambition for the wealth of the Lydian king Gyges or for a great tyranny: "these

things are far from my eyes". The term was subsequently applied, however, to a number of Greek figures – Pheidon of Argos, Polycrates of Samos, Cypselus and Periander of Corinth, Cleisthenes of Sicyon, Pisistratus and Hippias of Athens – who came to exercise dominant positions within their cities in the Archaic period of Greek history (7th to 6th centuries BC). These men were, characteristically, fringe members of a ruling elite of their city who took power with the help of a faction of supporters. In some cases it is possible that they represented a body of those who felt excluded – due to their status or their geographical position within the city's territory – from the political constitution. The common view, however, that the Archaic tyrants were the product of a newly wealthy class of hoplites (or heavily armed soldiers) who felt that their contribution to the city merited a share in its political offices, is, at the very least, a caricature. Many tyrants seized power with no sign of any great ground-swell of support, sometimes with only a handful of men. Arguably tyrants were motivated by little more than a desire for glory and power.

There are some signs of the contemporary popularity of the Archaic tyrants. Stories of miraculous escapes from death or of their usurpation being forecast by miracles may suggest that their rule was seen as divinely sponsored. Later writers often dwell on the mild and constitutional nature of tyrannical rule: tyrants are seen as exercising an excessive influence on the selection of magistrates but allowing such magistrates to rule according to the constitution of the city – even though such constitutions were themselves probably very ill defined. Tyrants seem often to have initiated massive building projects; such largesse must have bought them popularity. Tyranny, nevertheless, came to be seen as archetypally unconstitutional, often contrasted with kingship, the archetypally constitutional form of monarchy. This view of tyranny was first defined in theoretical terms by the historian Herodotus in his *Debate on the Constitutions*, a discussion between three Persians, shaped also by a stereotypical image of oriental kingdoms, on the relative merits of oligarchy, democracy, and tyranny. The tyrant, according to the Persian Otanes, "disturbs the ancestral laws, rapes women, and kills men without trial"; the unaccountability of a monarch will necessarily breed hubris and violence. Stories abounded of the crimes of tyrants, perhaps most colourfully of the bronze bull in which Phalaris of Acragas roasted his enemies.

Though some such stories may have a historical kernel, to a large extent they probably derive from the backlash subsequent to the fall of a tyranny. Tyrannical rule rarely lasted more than two generations. Inherited rule seemed perhaps more patently unjust. Stories of cruelty

tend to be focused on the second rather than the first generation. In some cities – Corinth is the most prominent example – tyranny was replaced by a broader oligar-chic clique. In Athens, however, the city for which there is the best evidence, tyranny was followed by democracy. The idea of tyranny indeed seems to have been defined in opposition to the ideal of accountable, democratic government. When the early 6th-century ^{BC} Athenian reformer Solon had warned of the threat of tyranny in Athens, he seemed to conceive that men might aspire to tyranny. The imaginary tyrant was an ever-present bogeyman of the democracy. The institution of ostracism (a period of ten years' exile imposed on leading politicians) was probably introduced, for example, as a safeguard against the excessive power of individuals in response to the expulsion of the Athenian tyrants. The charge of aiming for tyranny was one that was frequently laid against Athenian leaders, most famously Alcibiades.

The distinction between tyranny and democracy took on an additional sharpness of focus, and a patriotic gloss, in the light of the Persian Wars fought between the Persian kings Darius and Xerxes and the cities of Greece (490–479 ^{BC}). The Persians had been responsible for maintaining a number of petty tyrants in power within their sphere of influence in Asia Minor. The association of tyranny with the Persian enemy was ensured in Athens by the participation of Hippias, the expelled Athenian tyrant, in the Persian campaign that culminated in the battle of Marathon (490 ^{BC}). Already in Aeschylus' play the *Persians*, performed in 472 ^{BC}, the superiority of the Athenian system of government is seen as a crucial factor in the Greeks' victory. Like the tyrants of Archaic Greece, Darius, Xerxes, and subsequent Persian kings down to Darius III (the defeated opponent of Alexander the Great) were portrayed in an almost consistently lurid light: whimsically cruel, sexually decadent, surrounded by powerful queens and a population of slavish "yes-men".

In addition to the Archaic tyrants, another group of rulers are commonly referred to as tyrants: Gelon and Hieron of Syracuse in the 5th century ^{BC} and Dionysius I and II in the 4th. These Classical tyrants are usually seen as being very different in character from their Archaic counterparts: essentially military dictators, in the size of their power bases they preshadowed the rule of the Hellenistic kings who followed on from Alexander's conquest of the Near East. But just as in the case of the Archaic tyrants – where, however, the simultaneous appearance of so many figures lends the group an artificial coherence – tyranny is essentially in the eye of the beholder, an accusation rather than a position. The charge of tyranny was one that could even be turned against Athens. The Athenian writers Aristophanes and Thucydides (as well as the pamphlet often known as the *Old Oligarch*) reflect in their

work the idea that the Athenian dominance over their allies in the 5th century BC also constituted a tyranny. A compelling argument makes out that Herodotus, writing his *Histories* in the early years of the Peloponnesian War, draws parallels between the empires of the Athenians and the Persians before them.

U

Ukraine

It is now thought that Greeks from Miletus first settled in the Ukraine in the course of the 6th century BC, though a century earlier has been claimed. Settlement was either coastal or along the banks of the major rivers of the region and their estuaries. By about 550 BC the town of Olbia was established near the modern village of Parutino, on the west shore of the estuary of the river Bug (the Greek Hypanis), when an agora and religious precinct were laid out. Numerous minor Greek settlements fringed the whole estuary around Olbia, while the islet of Berezan just beyond the mouth of the estuary had been settled at the same time as Olbia itself, if not a little earlier. The island was named Borysthenes by the ancient Greeks, as was the great river Dniepr which emptied into the Black Sea immediately to its east, beside the Bug. The name Borysthenes was also attached to Olbia itself, especially in more literary accounts of the town, such as that of Dio Chrysostom, composed about AD 100 (*Oration* 36). Dio's gloomy account is not to be taken at face value, as archaeology now shows: it is designed to make a philosophical argument about civic culture and harmony, for presentation at Prusa in northwest Asia Minor. Later, in the 10th century, the Byzantine emperor Constantine VII Porphyrogenetos (913–59) in his famous survey of his realm looked upon the Dniepr as the principal highway to the first Russian state, the Rus of Kiev, and beyond as far as the Baltic. It was down this river that furs, amber, and mercenaries came into the Byzantine world, including the Varangian bodyguard of the emperor himself.

The hinterland of the Crimea was a continuation of the Ukrainian steppe to the north: Greek settlement followed its coast. The largest Greek cities were Chersonesus (modern Sebastopol) in the southwest Crimea and the cities of the Bosporan kingdom that formed its eastern part, especially Panticapaeum (Kerch) and Theodosia. Recent work has indicated Greek settlement also on the northeast coast, on the shallow Sea of Azov, which was dominated by the Bosporan kingdom as far as the Don (the Greek Tanais). The Greeks reasonably treated Azov as a lake and named it Maiotis.

Chersonesus offered excellent harbours, but seems not to have been established as a Greek settlement until about 422 BC, when settlers came from Heraclea Pontica. No doubt the local Tauri, famously ferocious, were a main reason for earlier neglect of the site. It was here that Euripides set his *Iphigeneia in Tauris*, first performed in

Athens about 412 BC and a very popular theme in art thereafter. Euripides' version of the myth stresses that the cult of Artemis at Halai Araphenides (modern Loutsa in Attica) took its origin and ritual from the Taurian form of the cult.

Theodosia was founded by Milesian Greeks in the 6th century BC on the southeast coast of the Crimea; for the Byzantines it was Theodosiupolis, and later for the Genoese the great trading port of Kaffa. In the 4th century BC much of the grain imported into Athens seems to have come from Theodosia and its hinterland. At the eastern extremity of the Crimea lay Panticapaeum, the capital of the Bosporan kingdom. It too was established in the 6th century BC by Milesian Greeks. About 438 BC the Spartocid dynasty formed the Bosporan kingdom, which embraced both the eastern Crimea and the Taman' peninsula across the straits of Kerch to the east. It was to last into the 3rd century AD. Pericles, who led an expedition to the Black Sea in the 430s BC, may have played a role in creating the dynasty. Certainly, Athens subsequently developed close social and economic ties with the kingdom, whose rulers could even receive Athenian citizenship in the 4th century BC. Although Bosporan rulers had other cultural allegiances (Iranian and perhaps Thracian), the language and principal culture of their realm were firmly Greek throughout its history.

Across the whole region and through most of their history Greek communities of the Ukraine had to come to arrangements with local populations who were often nomadic – Scythians, Sarmatians, Goths, and others. For the most part, the Greek literary tradition stresses hostility with these peoples, while epigraphic and archaeological evidence reveals also more friendly or at least structured interaction and exchange, including formal treaties. The great ramparts across the breadth of the eastern Crimea, with which the Bosporan kingdom shielded itself, indicate the significant threat of assault by land. However, in surveying the region in book 4 of his *Histories*, Herodotus observes the existence of Scythian–Greek intermarriage and mixed populations, as near Olbia. He also describes a Hellenized settlement in the Ukrainian hinterland (perhaps modern Bel'sk), settled by the Geloni, whom he regards as of Greek descent, but as in his day speaking a language that is a mixture of Scythian and Greek (4. 108–09). No doubt Greeks of the region mediated exchange between the Scythians and the Aegean world: it was presumably through the Greek settlements of the region that the Scythian archers came who maintained public order for 5th-century Athenian democracy. For the Greeks of the Aegean the whole region was a reservoir of resources (slaves, grain, leather, and other goods).

From the perspective of the mainland Greeks the Ukraine was viewed as significant also for its peculiar geography and climate. The

flat grassy steppe was contrasted with Greek landscapes, while the great rivers of the region had few parallels among the rivers of Greece. The climate was imagined as very cold, rather colder than it was in fact. The medical writers in particular viewed the region as a source of enlightenment about the effects of severe cold on the human body, for example in reducing fertility. The fate of Greeks in the Ukraine in modern times replicates that of Georgia.

Urbanization

When Aristotle famously described man as a political animal the strict meaning of the Greek – *politikon zoon* – is "an animal that lives as part of a polis", that is, a member of what is usually translated as a "city state". Latinized he would be an urban creature. The implication is that urbanization, the forming of cities, is the natural way of life for a

Greek community. In its simplest form, this is true. In both ancient and modern Greece people prefer to live together, forming communities, rather than isolated in individual homesteads. An obvious original reason for this is the need for security; isolation is potentially dangerous, particularly in unsettled times. On top of this, though, come the social reasons: the need to belong, to be part of the whole, rather than a self-contained individual. Human fulfilment required the larger grouping.

This in turn requires an understanding of the communities, the *poleis*. There is no implication of great size. Many of the city states in Classical Greece are more readily defined as villages, rather than cities in the sense of modern urban sprawl, while at the same time the population was not necessarily concentrated in a single urban centre; in the largest of them, Athens, the majority of the citizens lived not in the city of Athens, as defined by its encircling fortifications, but in outlying villages scattered throughout the various regions of Attica. It was the village that formed the essential starting point. It was from this that urbanization, in the strict sense, started.

Urbanization was a response to the political condition of the times. The earliest urban communities of Greece developed in the Middle and Late Bronze Age, initially in Crete. They vary in size, from Gournia, no more than a village in modern terms, to the much larger (and still mostly unexplored) communities at places such as Knossos. All centred on the architectural complexes usually termed palaces, presumably the residences of monarchs but including the administrative (in all senses), economic, and religious functions that their owners represented. Similar urban groupings, some much larger than the Cretan examples, are, of course, found in the Near East at an even earlier date; there is every likelihood of direct influence on Crete, just as in the same way the Cretan examples influenced similar developments in mainland Mycenaean Greece. What is uncertain, in what is essentially a prehistoric context, is the relationship between the palaces and the urban areas surrounding them. Some of the “villas” or “mansions” (terms applied by the archaeologists who have explored them) round the palace at Knossos are substantial and opulent, but it is unclear whether they were “official” buildings or the residences of well-to-do individuals. Similarly, houses outside the palace at Mycenae have been attributed to merchants, though again the ownership is unclear.

What is certain is that with the destruction of the palaces and their organization the urban centres collapsed; in the succeeding Dark Age it is assumed – there is little archaeological evidence – that a village pattern resumed. Some of these villages were the settlements of newcomers. Those that coalesced into the city state of Sparta, which

retained their village form long into the Classical, historical period, are a good example. Others were formed by survivors from the earlier populations, and for these, in mainland Greece, the heavily fortified citadels that surrounded the sites of the former palaces often became the urban nucleus. Some (Mycenae) hardly outgrew their citadel. Others (Athens) from an early date spread over the lower ground below the Mycenaean citadel walls of the Acropolis. It was all this that developed as the urban centre for the enlarged city state, which came to include the other villages of Attica.

Thus in Classical Greece urbanization meant the provision of an urban centre rather than simply a place of residence for an enlarged population. Compared with a modern city, a much greater proportion of the area within a city's defined boundaries was devoted to public building, religious, economic, administrative. It included places, which may or may not be actual buildings in the architectural sense, where the citizens could gather for political or religious purposes. The central "gathering place", the agora, in Athens was the place where in the 5th century BC the citizens collected when they voted to banish (ostracize) politicians who had lost their favour, while on the adjacent hill of the Pnyx was the open-air location for the political assembly, the Ekklesia. Those who attended came from the whole of Attica, not merely the city itself. Within the urban area the Acropolis (now demilitarized, the city fortifications instead now including the whole town) formed the gathering place for the entire population of Attica when they came to worship Athena at her annual festival. With the growth of wealth and the desire for prestige that came with it, the city was embellished with fine buildings, to modern thinking completely out of scale compared with the size of the actual population dwelling within the walls.

A further stage in urbanization was the deliberate, planned construction of cities. This started in the colonies that the Greeks founded overseas, where the settler community was concentrated in the urban centre, the outlying land being allotted to them, often with non-Greek inhabitants to work it for them. Such artificial cities are easily recognized by the use of a regular grid plan for their street system, facilitating the allocation of equal-sized individual plots to the settlers. Himera, in Sicily, is an excellent example of such a city. The concepts involved in this were elaborated into theories of urban planning and the proper form a city should take, with the emergence of individual town-planning experts, the most famous of whom was Hippodamus of Miletus. He may have been responsible for the planning of his native city when it was recreated after its destruction by the Persians; he certainly planned the new harbour city of the Athenians at Piraeus. The basis of his theories was the inevitable grid

plan of streets, but planning extended also to the proper location of the different areas and structures a city requires.

Thus during the 5th and 4th centuries BC a new category of urbanization developed, the deliberate bringing together of people from a wider area and its villages into a large, planned urban centre. The motives were various, but the underlying purpose was to create more powerful communities. The city of Rhodes, formed by the amalgamation and transfer of population from three older poleis, Lindus, Ialysus, and Camirus, embraced a large area within strong fortifications, though it seems never to have been fully built up. Other cities were moved to new, planned sites, such as Priene and Cnidus, these perhaps at the behest of a foreign ruler, Mausolus of Caria. By the 4th century BC urbanization, often on a substantial scale, was considered an ideal; it formed a crucial element in propelling backward areas, such as Macedon, into the forefront of up to-date powers, even if politically they adhered to the older concept of monarchy. A culmination comes with the laying out of Pella as the Macedonian capital. Here urbanization created a spacious city, with broad streets, proper drainage and water supplies, and opulent houses. No doubt it represented a considerable improvement in the standard of living for the people who came to inhabit it; at the same time they were content with a regime that controlled them, rather than a political system under which they governed themselves.

So the Greek city was transformed from a political to an urban organization. In the Hellenistic period, and following the conquests of the Macedonian Alexander the Great, this was extended, and many more urbanized places were organized. Some of these were too artificial, too remote from a natural *raison d'être*, and failed (though one of the remotest, Ai Khanum in Afghanistan, was remarkably successful). Others prospered. In Greece itself Cassander's foundation of Thessalonica was one of the triumphs of the urbanization movement. In the newly conquered areas the greatest of the Alexandrias founded by Alexander the Great, that "next to" (rather than "in") Egypt, to use the official nomenclature, became one of the greatest cities of the whole ancient world. Urbanization was a policy that was synonymous with the concept of Greek political superiority and domination.

Even after the collapse of the Hellenistic monarchies, the Romans continued the policy of urbanization, using the cities as an essential method of local political control, extending the policy to the non-Greek parts of their empire. The Hellenistic and Roman periods thus saw the apogee of Greek urbanization. The cities played a vital role in the political and economic order of things, and were rewarded accordingly. Where the Classical cities had built for the gods, the

Hellenistic and Roman cities built for man; or at least, those men who were privileged to be part of them. Public buildings were constructed on a magnificent scale. The agoras were lined all round with stone colonnades (stoas), behind which were shops, offices, rooms for dining and feasting. Each city had its theatre; its gymnasium – which became places of education – were no longer mere open fields, but colonnaded courtyards, with assembly rooms and running courses (that at Cyrene roofed to provide shade from the African sun). Streets were wide, and paved; in late Hellenistic and Roman cities they were monumentalized with long lines of columns. Water supplies were, where necessary, piped in (Priene affords a 4th-century BC example of this), or, where suitable springs were not available, stored in specially built and often cavernous cisterns (Alexandria). Much was done at the expense of the kings and the Roman emperors who succeeded them. Where cities fell back on their “own” resources, this often meant the pockets of the well-to-do, from whom lavish public expenditure was an expected duty.

In many senses the heyday of Greek urbanization was the 2nd century AD; the worsening conditions of the 3rd century brought an end to much urban development (it has been suggested that excessive expenditure on urban amenities hastened, or even created, the economic collapse of the mid-3rd century AD). Even so, the concept of the urbanized ideal continued, so that when the emperor Constantine founded his New Rome at Constantinople, it was conceived on the grand urbanized scale, with the same lavish amenities, as in earlier times. Constantinople flourished as the new imperial centre. Other Greek cities declined, impoverished by the Byzantine financial system, or the victims of political change. A few survived right through the Middle Ages, though often much reduced, such as Thessalonica. But even the greatest, Alexandria, dwindled to a small town, though the ghost of its vast Hellenistic grid plan was still discernible in the sands as late as the early 19th century. Under the Turks, Athens was a small, squalid town huddled against the north slopes of the Acropolis.

V

Verroia

City in Macedonia

This large town of south central Macedonia is one of the few in the region that has enjoyed a more or less continuous existence from antiquity to the present day and has retained its original name over the centuries (the same is also true of Thessalonica and Serres). Verroia stands on the site where it was originally founded, i.e. on the slopes of a hill at the eastern extremities of Mount Vermio, overlooking the vast coastal plain of central Macedonia. In antiquity Verroia lay much closer to the sea than it does now, for the Thermaic Gulf extended so far inland as to include the area of the future lake of Giannitsa. Located in the heart of Macedon, in the neighbourhood of the royal residence and cemetery of Aegae (modern Vergina, where the tombs of the Argead dynasty have been excavated), Verroia was already in existence in the 5th century BC, if not earlier, and was one of the main urban centres of the ancient Macedonian state. The town's name is believed to derive from Veres, a hero of the Macedonian religious tradition.

Being the birthplace of Antigonus I, the renowned general and one of the successors of Alexander the Great, Verroia was particularly favoured by his descendants who ruled in Macedonia as the Antigonid dynasty between 294 and 288 BC and from 277 BC to the end of the Macedonian kingdom in 168 BC. The town's prosperity continued during the Roman era, when Verroia is attested as a place of significant commercial activity and also the centre of the *concilium* (*koinon*) of the Macedonians, an ethno-religious league of the Macedonian towns and districts under Roman rule. A Jewish mercantile and artisanal community existed there by the 1st century AD, a fact that attracted St Paul to visit the town and preach there. The only obscure period in Verroia's history coincides with the so-called Byzantine dark age (7th and 8th centuries). The serious demographic crisis and urban decline that mark the Byzantine Balkan provinces during that period must have affected life in Verroia and the development of the town. This probability is supported by the absence of any record of the town's existence for that period, and also by the fact that the surrounding district was occupied by the Slavic tribes of the Drogouvites and Sagoudatoi that were independent for a long time and had uneasy relations with the Byzantine authorities.

Village Society

The first traces of permanent human settlement on the Greek peninsula date back to the early Neolithic era, long before its penetration by Greek-speaking tribes around the end of the 3rd millennium BC. Archaeological excavations have revealed remains of permanent settlements of agriculturalists and sedentary pastoralists consisting of densely built single-room habitations surrounded by gardens. Their burial customs indicate a society organized in clans, while the absence of sizeable buildings denotes an egalitarian society without centralized forms of government or administration. Excavations of large private buildings of the Bronze Age with ample storage areas and numerous yards possibly designate the emergence of social stratification.

As we advance into historical times, social stratification became increasingly complex as did the interrelations between the different echelons of the social ladder. The formation of the city state in the 8th century BC, in particular, defined a situation where villages became dependent on urban centres. Village society at the time consisted of independent households of free peasants. The family unit was the economic and social nucleus of a society whose economy depended on agricultural production. However, the majority of peasants were owners of small plots of land that were often insufficient for the subsistence of the household. While peasants were faced with poverty, large landed properties began to form, increasing the social distance between villagers and aristocrats. Peasant contributions, furthermore, were appropriated by the aristocracy, who thus augmented their wealth.

Vine

Viniferous species of grapes (*vitis vinifera sativa*) were known to the Mycenaean Greeks. The mythological account of Dionysus' importation of the vine from Asia Minor, the evidence of wine on the Linear B tablets, and the remains of storage vessels make it clear that by the 2nd millennium BC grape growing was firmly entrenched on the Greek mainland.

Yet only with the rise of the polis (800–300 BC) did domesticated cultivars, which produce larger and better-quality fruits, become truly ubiquitous. The Classical Greeks planted vineyards from the Black Sea to Crete, and from southern Italy to northern Asia Minor, where, along with olives and grains, they became part of the great triad of Greek agronomy – an agricultural diversity that helped to make the ancient rural household self sufficient and the city state prosperous. Vines could grow well on difficult terrain and produce on poor soils; they were resistant to extremities of temperature and humidity, and provided the farmer with in-season fresh fruit and juices, storable raisins, and non-perishable wine. That versatility of the grape prompted the 7th-century BC poet Alcaeus to advise: “Plant no other tree before the vine.”

The wide variety of soil and weather conditions in Greece and Italy allowed for regional specialization, as the Aegean islands, the bay of Naples, and Rhodes earned a Mediterranean-wide reputation for premium vintages. There is some practical advice found in Greek agricultural writers such as Theophrastus on establishing the vineyard, but the full sophistication of the Greek art of viticulture can be appreciated only in extant and derivative Latin texts such as Cato, Columella, and Varro. It is clear from these authors that the Greeks translated empirical observation into a more abstract and theoretical knowledge of the proper combination of climate, soil, and vine species necessary to produce premium grapes. Such scientific treatises attest to the Greek mastery of viticulture from the arts of vine trellising, fertilization, pruning, and pest management to the intricacies of wine pressing and processing – a level of expertise not surpassed until the 19th century with the rise of bacteriology, soil chemistry, and plant biology.

The polis Greeks saw viticulture as emblematic of Classical culture at large, whose stable populations, local councils, sturdy yeomen, and fiercely independent rural communities were the natural dividends of the time, patience, expertise, and investment necessary to grow good grapes. Thus vine growers are idealized as dependable, though crusty sorts, in the comedies of Aristophanes and Menander. The livelihood of entire communities might depend on the success of the autumn vintage, and during wartime it was a crucial factor in state policy. In

Thucydides' history, for example, the small north-east-Greek city state of Acanthus sued for peace when its grape harvests were threatened by Brasidas and his Spartan invaders; similarly the Acharnian viticulturalists outside Athens were especially critical of the Athenian leaders when their vineyards were left unprotected before the annual Spartan invasions of Attica (431–425 BC).

In Hellenistic and Roman times, agriculture in general and viticulture in particular in the Greek world became increasingly divorced from the Classical ideal of agrarianism and evolved more into a cash enterprise, where large absentee estate holders, through the use of slave gangs and skilled overseers, grew grapes aimed at particular specialized wine markets, often at great distances and throughout the Mediterranean. Athenaeus (c.AD 200), for example, provides a comprehensive catalogue of choice regional wines that attests to the sophisticated commercial nature of Greek viticulture in Roman times. Yet even as exports grew, viticulture ceased to be part of a vibrant countryside, which for the most part suffered continual depopulation due to emigration, banditry, and oppressive taxation.

Volcanoes

Humanity has always had an ambiguous relationship with volcanoes. Volcanic eruptions can be tremendous forces of destruction, but soils produced by the weathering of volcanic rocks are very fertile in the right climate. For the archaeologist, eruptions can preserve aspects of communities almost instantaneously. The earliest record of a volcanic eruption is a wall painting from Çatal Hüyük, central Turkey, dating from 6200 BC. This is beyond the scope of this volume and here only

the volcanoes of post-Stone-Age Greece and Italy will be discussed.

The recently active volcanoes of Greece lie along an arc from Corinth to Nisyros, near the Turkish coast. They are produced by the melting of the Mediterranean sea floor as it is subducted beneath the Aegean region. The sea floor descends at an angle of about 45 degrees until parts of it melt at a depth of 150 km. The magma (molten rock) then rises and is stored in chambers at depths of 5 to 10 km before eruption.

The most famous Greek volcano is Thera (Santorini). It had been dormant for a long period before the famous "Minoan" eruption in 1450 or 1650 BC – the exact date is still disputed. Before the eruption the present bay was probably almost filled with a volcano, similar to but larger than the present Kameni islands. The eruption started on this volcano and quickly destroyed it, creating a caldera (giant crater) 8 km in diameter. At its maximum the cloud of volcanic ash rose to more than 35 km in the atmosphere and was dispersed as far as Turkey, Israel, and Egypt. On the island the ash was up to 40 m deep and buried all the settlements, including the well-preserved village now known as Akrotiri. Towards the end of the eruption parts of the island collapsed into the caldera. These giant landslides, or particularly violent episodes of the eruption, produced a tsunami (tidal wave) more than 40 m high. Such a wave must have caused considerable erosion, damage to coastal communities, and the salination of agricultural land on nearby islands. These destabilizing effects may have led to the collapse of the Minoan civilization on Crete.

Since then, sporadic minor lava eruptions have created the Kameni islands. The only violent eruption was in AD 726, when so much pumice was produced that it reached Constantinople. There it was noticed by Leo III who interpreted it as a sign of divine displeasure and imposed iconoclasm. The last eruption was a minor one, in 1950. Another volcano 15 km northeast of Thera erupted in 1650. It started underwater and built up a small island, which was rapidly eroded below sea level. Gas from this eruption killed animals and people on Thera.

The largest volcano of this arc is Melos and its archipelago. Volcanism started 3 million years ago, but essentially finished 100,000 years ago. In antiquity the most important volcanic product of the island was obsidian, a natural glass that occurs in ancient lava flows. It was used for knives from the 9th century BC. Recently, exploitation has turned to clay (kaolinite and bentonite) and volcanic ash (perlite). The easternmost volcano of the chain is Nisyros, a small island that has not had any eruptions of lava during historical times. However, there have been a number of steam explosions caused by the

interaction between rainwater and magma at shallow depths. These made an impressive series of craters in the interior of the island, the last in 1887. Another small volcano is the peninsula of Methana, in the Saronic gulf. Fresh lavas in the northwest may have been erupted in the 3rd century BC.

In Italy there are recently active volcanoes around Naples (Vesuvius and the Phlegraean fields), on the Aeolian islands, and in eastern Sicily. As in Greece, this volcanism is related to the subduction of the Mediterranean sea floor. Here, however, the geometry is more complex and no single arc has formed. Mount Vesuvius is probably the best-known volcano in the world. The oldest parts, known as Mount Somma, started to form some 12,000 years ago. Construction continued intermittently until 1100 BC, when the volcano was about 2,000 m high. A long period of repose ended with the famous eruption of AD 79, when the top of the mountain was completely removed in three days. A cloud of volcanic ash rose to 30 km and fell on the surrounding countryside: Pompeii was buried to a depth of 7 m. Rain falling on the ash near the vent transformed it into hot mud flows that swept down and engulfed Herculaneum. Eruptions of ash since that time have partly filled the crater to form the present cone of Vesuvius. Most of these were small, except that of 1631. The last eruption was in 1944.

The Phlegraean (“burning”) fields volcanic area lies just to the west of Naples. It comprises more than 50 small ash cones, some under the gulf of Pozzuoli. A large magma chamber underlies this region at a depth of a few kilometres. Magma movements can produce rapid changes in the height of the land. The effects of these changes can be seen in the Roman market place (Serapheum), where marine molluscs drilled holes in the columns at a height of several metres above the present sea level. The most recent eruption produced Monte Nuovo in 1538.

Most of the Aeolian islands are volcanic, but only three are of interest. Lipari was a major source of obsidian in the western Mediterranean. It was obtained from lava flows erupted during the 4th millennium BC. The last eruption was in AD 729, when up to 200 m of pumice was deposited in the north, burying the Roman acropolis. The eruption terminated with new flows of obsidian. The island of Vulcano has two independent volcanoes, Fossa and Volcanello, which were linked by an isthmus during the 16th century. Fossa has generally been more active with explosive eruptions about twice a century. The last eruption was in 1886–89; hence we can expect a new eruption soon. Stromboli is a small, almost perfect, volcanic cone that has been active for at least 2,500 years. However, the activity is not generally intense and consists of small explosions every 5 to 10 minutes from

the summit craters. These are caused by large gas bubbles that rise up the narrow conduits and burst, scattering parts of the bubble wall.

Mount Etna, the mythical forge of Vulcan and also home of the Cyclopes, is the largest volcano in Europe but also one of the youngest – it was mostly formed during the last 150,000 years. The volcano has been almost permanently active for at least 2,500 years. The lava flows from fissures or small ash cones on the flanks of the volcano and more rarely from the summit craters. At other times there are explosions and small eruptions within the craters.

Votive Offerings

Strictly speaking, the term “votive offering” signifies something dedicated in consequence of a vow. Partly because the exact circumstances of a dedication are not always known, partly because a gift to the gods can almost always be taken to imply some kind of a vow, the category is elastic.

Comparison of the modest tin votive plaques readily available to worshippers in Greece today with the terracotta plaques or representations of parts of the human body from the ancient (4th century BC) sanctuary of Asclepius at Corinth or, on a larger scale, with the stone relief of a leg from Epidaurus demonstrates the identity of practice. Furthermore the existence of early Christian votive plaques supports the idea of a continuous tradition.

More substantial gifts to churches from the early Christian period onwards (furniture, church plate, icons) can often be seen to be votive from accompanying inscriptions, and the votive dedication of churches themselves in Byzantine and later times is demonstrated by

the known origins of numerous chapels in the Greek countryside and elsewhere. Similar gifts to sanctuaries, deities, or other superhuman authorities are attested in antiquity by inscriptions and literary sources as well as the objects themselves. Ancient figurines and statues are regularly inscribed ("Mantiklos dedicated me to Apollo"; "The Messenians and Naupactians dedicated [this statue] to Olympian Zeus as a tithe of the spoil of their enemies").

The custom of making votive offerings may well go back into prehistory, since some of the objects found in prehistoric shrines, such as the terracotta animals in Minoan peak sanctuaries and in other sacred places, seem certainly votive. The subject is best presented with primary reference to antiquity.

Since the definition of a votive offering is by the intent of the donor, whether an individual or a group, and is dependent also on economic circumstances, the range of types, sizes, material, and value is immense. The material may be perishable (vegetable), cheap (wood, terracotta), or more valuable (stone, metal, precious metal). The type may be anything from a wreath, a candle, or a tiny object to a building. The treasuries (small temple-like buildings but without colonnades) that individual Greek states erected in sanctuaries to house the ritual equipment that their representatives used on ceremonial occasions were a kind of votive offering, intended to glorify the sanctuary and its patron deity. Temples such as the Parthenon, which were additional to the temple that housed the cult statue of the sanctuary, could be votives. If the item concerned was itself representational, or else decorated with figures, possible subjects include images of the deity addressed, images of the worshipper (often with the intention of making permanent an act of piety depicted, e.g. the bringing of an animal for sacrifice), images of sacrificial animals, or sacred objects. Otherwise, attractive or precious items of any kind at all could be offered. Occasions of offering can be summarized by quoting the chapter headings of Rouse (1902), with some additional comments.

Rouse's categories are: (1) to the dead, heroes, chthonian deities (in anticipation of or gratitude for help or favours); (2) tithes, first fruits, kindred offerings (whether crops or the products or profits of trade or business); (3) war (spoils, commemorative statues, etc.); (4) games and contests (prizes, instruments, commemorative statues); (5) disease and calamity (models of the diseased part; an inscription relating a cure); (6) domestic life (items relating to marriage and childbirth); (7) memorials of honour or office (herms, honorific statues or reliefs); (8) memorials of feasts and ceremonials (inscribed vases, representations of the animal sacrificed or the votary carrying a sacrificial animal or object); (9) propitiation (offerings given in redress for impiety, such as

the “Zane” statues at Olympia); and (10) rarities and valuables (as the due of deities).

W

Warfare

Civilized warfare on a grand scale in Greece began with the rise of Mycenaean civilization during the 2nd millennium BC. From roughly 1600 to 1250 BC palaces at Mycenae, Pylos, Tiryns, Thebes, and elsewhere fielded well-equipped forces that put a high premium on the use of the horse, chariot, and bow. By the last century of Mycenaean civilization well-protected foot soldiers with spear and sword were fielded in response to seaborne attackers. From the evidence of the linear B tablets, painted pottery, engraved jewellery, and the physical remains of the vast fortifications of the citadels, the Mycenaean palace armies were probably small, tightly controlled by royal dynasts, and generally inflexible in their response to less well-organized raiders and plunderers, who posed a far greater threat to their stratified societies than did other royal armies in Asia Minor and Egypt. By 1200 BC most of the palaces were destroyed, the population had plummeted, and material culture was impoverished. For the next four centuries Greek warfare of the Dark Ages was probably characterized by the haphazard raiding and skirmishing of mounted grandees accompanied by small bands of attached light-armed foot soldiers.

The rise of the Greek polis – by 700 BC there were probably more than 1,000 city states in the Greek-speaking world – was probably the result of an emerging middling class of adroit and independent small farmers. Their peculiar practice of phalanx warfare was inseparable from their own agrarian chauvinism and political autonomy, and marks the true beginning of western infantry practice. The predominately agrarian character of these citizen militias tended to define hoplite war as a single collision between phalanxes of heavily armed infantry – a decisive engagement in which casualties were limited, victory and defeat clear-cut, and damage to the surrounding countryside and civilian population limited. Such fighting did not require taxation, public investment in war material, or fortifications, and thus helps to explain the astonishing rise of the Archaic city state itself.

Infantrymen were known as hoplites, due to their cumbersome gear (*hopla*): bronze breastplate, greaves, and helmet; a wooden double-grip concave shield; a spear about 2.7 m long; and a secondary short iron sword. The large shield, more than 7 kg in weight and 90 cm in diameter, also explains the nature of hoplite fighting. The infantryman

depended on the man next to him to shield his own unprotected right side and to maintain the cohesion of the entire phalanx, military service now reinforcing the solidarity of the citizenry. The shield's unique double grip allowed its weight to be held by the left arm alone, and its concave shape permitted the rear ranks to rest it on their shoulders as they pushed on ahead. The weight of the panoply – ranging anywhere from 20 to 30 kg – meant that hoplite battle would be short and decisive: infantrymen massed into the columns of the phalanx and charged each other head-on, soldiers seeking cover from the array of shields and victory through the sheer force generated by spearmen pushing against the backs and sides of their friends and family ahead. On flat ground, hoplites in formation were usually invulnerable to mounted assault by the more wealthy and the harassment of poorer skirmishers.

Generals fought in the front rank and their tactical options were exhausted with the prebattle placement of particular contingents along the battle line and the choice of terrain. Before the 6th century BC fleets were rare and sea battles essentially non-existent. Armies were challenged to fight by formal notification and occasionally coerced to action by the ravaging of local crops. Battle itself was not much longer than a half-hour or so; pursuit was haphazard. The Persian (490–479 BC) and Peloponnesian (431–404 BC) wars changed all that, and revealed the tactical limitations of hoplite armies when faced with forces that did not share the same protocols of warfare and fought in theatres and on terrain far removed from flat plains. During the 5th century BC Athens turned to its fleet and soon developed sophisticated methods of defensive and offensive naval manoeuvres, attacking through or around an enemy line of ships to achieve easy ramming. In contrast, the Spartans sought to improve on the simple collision of hoplite battle by mastering outflanking movements on the right wing, made possible by the superior drill and training of their professional corps. Thucydides' magnificent description of Mantinea (418 BC) reveals how such tactical competence might shatter an enemy line and change the entire course of battle. At the battle of Delium (424 BC) the Theban general Pagondas first employed reserves, massed phalanxes deeper than the standard eight shields, and used horsemen for more than just preliminary skirmishing. Cleon, Brasidas, and Demosthenes during the Archidamian War (431–421 BC) experimented with light-armed troops to attack hoplites, through manipulation of terrain, darkness, and sheer surprise. No-one sought decisive confrontation through traditional hoplite pitched battles, since warfare was now beginning to be governed more by military necessity than by cultural restraint.

Epaminondas the Theban (d. 362 BC) is often considered the father

of Greek infantry tactics. In fact, none of his “discoveries”—a deepened phalanx, the use of superior troops on the left, the oblique order of march, the incorporation of elite units, and the combined use of horsemen – was novel per se. Rather his originality lay in combining these previously known tactical options into a unified battle plan – one uniquely suited for his phalanx of dour Theban agrarians who had a reputation in antiquity for physical prowess and infantry ferocity. Epaminondas’ victories at Leuctra (371 BC) and second Mantinea (362 BC) proved that an innovative heavy infantry might alone still clear a battlefield of the enemy. Yet, his grand invasion of Laconia (370–369 BC) that freed the Messenian helots did more to emasculate Sparta than did his defeats of Spartan hoplites in pitched battles, proving that victory now required the use of infantry as part of larger economic and cultural strategies. More abstract 4th-century BC reactionaries also sought to maintain infantry superiority through more innovative use. Plato and Aristotle, for example, speculated on novel ways of preserving the noble tradition of hoplite supremacy within the city state; their advice ranged from the employment of infantry in expanded roles on the borders to the incorporation of stockades and fortifications within the old civic idea of a hoplite militia defence.

Nevertheless, throughout the 4th century BC most generals worried less about the tactical possibilities of infantry employment than learning the new uses of artillery, missile troops, peltasts, and cavalry, both for the attack on and defence of fortified positions. The more utilitarian philosophers and rhetoricians of the 4th century BC reflect this growing tactical renaissance, as they sought to apply dialectic and induction to generalship (*strategika*), the arrangement of troops (*taktika*), and weapons training (*hoplomachia*). War was no more a question of bravery or a reflection of values, but simply an art (*techne*), teachable like any other. Xenophon (428–354 BC), as author of monographs such as *The Cavalry Commander and On Horsemanship*, is the best example of this mixture of battlefield experience and philosophical training. His contemporary, the pragmatic Aeneas the Tactician, follows in the same utilitarian tradition. Aeneas’ apparently vast *Military Preparations* is lost, but an extant monograph about survival under siege covers everything from the mundane (e.g. passwords, reveille, codes, tunnelling, fire-signals) to the broader employment of mercenaries, sorties, and plans of evacuation.

Philip II (359–336 BC) and his son Alexander III (336–323 BC) of Macedon sought to combine infantry innovation with light-armed, missile, and mounted troops to form a true symphony of forces. Battle became longer, as much as several hours in duration. The general – nearly always mounted – now had a host of options and different troops at his command, which allowed the much smaller Macedonian

armies to create havoc at particular spots in the enemy's battle line, through which poured heavy cavalry and infantry, causing psychological terror and general collapse – as the Greek confederates learned at Chaeronea (338 BC), the last battle by truly independent city states. Perhaps Alexander's greatest tactical contribution was the idea of rapid and unceasing pursuit, as part of his overall aim of destroying the enemy outright on the battlefield. Heretofore, battle tactics had not been closely integrated with larger strategic issues. But Alexander saw troop arrangement as merely a part of grand strategy – his aim was not only to win on the battlefield, but to destroy both materially and spiritually the enemy's will to resist. Infantry battle would then logically lead to the invaded surrendering its territory and very culture to Macedonian royal control.

In that regard, Alexander entirely reinvented the notion of Greek tactics, which in the 4th century BC had evolved from, but not replaced, the original emphasis on formal infantry engagements to resolve border disputes. The original purpose of Greek battle had been to limit casualties and resolve disagreement through the simple and often economic use of force. With the decline of the agrarian city state in the 4th century BC, however, the Greeks enhanced decisive battle with auxiliary troops to make fighting longer and more elaborate – but not necessarily all-destructive. Under the Macedonians the West at last applied its full scientific and rational arsenal to the battlefield, as part of a larger effort to destroy a culture, rather than to defeat an enemy. Tactics at last now fully served strategy and Hellenic warfare became the most lethal in the history of civilization up to that time.

During the subsequent Hellenistic era (323–146 BC) Greek-speaking mercenaries were prized throughout the Mediterranean as pike-carrying phalangites that could rout indigenous tribal armies and alone stand up to the Roman legions. Pikes lengthened to nearly 6 m in length and were wielded by both hands, as body armour and the shield shrank or disappeared altogether – the safety of Greek mercenaries' lives was now less important than their ability to kill. After the failure of Pyrrhus in Italy (280–279 BC), the Greeks spent a century and a half resisting Roman invasions. Some of the great battles of the age – Cynoscephalae (197 BC) and Pydna (168 BC) – pitted Greek hired infantry on Greek soil against republican legionaries. But the inflexibility of Greek tactics, the cumbersome nature of the Macedonian phalanx, the greater manpower reserves of Italy, and the superior élan of agrarian Italian recruits led to the doom of the Greek-speaking armies. With the final subjugation of Corinth (146 BC) Greek military forces per se ceased to exist and the phalanx became the curiosity of pedantic armchair strategists. In some sense, Roman republican militias with their emphasis on group solidarity,

patriotism, and belief in a superior culture had become more Greek than the Hellenistic dynastic armies they conquered. The forces of Alexander's successors were every bit as despotic, top heavy, and corrupt as the old Persian imperial levies, whom the Greeks had conquered almost two centuries earlier.

Under the Roman empire Greece suffered from high taxation and general depopulation, ensuring that organized military rebellion was out of the question. Most Greek soldiers fought anonymously as hired soldiers in the legions on the northern and eastern frontiers of the empire. Yet except for a few horrific battles between rival Roman dynasts, Roman control brought Greece a half-millennium of general tranquillity (100 BC–AD 400) – the longest period free of major wars in Hellenic history. With the collapse of the western empire, Byzantine armies took over the exclusive protection of Greece. For the first time since the 2nd century BC, there were now to be independent Greek-speaking armies in Italy, North Africa, and Asia Minor. Under Justinian's skilled generals Narses (478–573) and Belisarius (500–65), Greek soldiers ranged from Italy to Persia, trying in vain to reconsolidate the western empire under the aegis of Hellenism and Orthodoxy. Sound tactics and the Byzantines' technological edge in shipbuilding, fortifications, and armament compensated for a general absence of manpower and hardy rural infantry. Still, small mobile Greek armies would keep foreigners out of Greece until the arrival of the Franks in the 13th century. The ancient and modern history of Greek warfare is characterized by remarkable success when local, highly motivated militias are used for defence, but eventual failure when Hellenic armies are sent far overseas without adequate material and spiritual support from home.

Water Management

Use and distribution of water

Whenever more than a handful of human beings settle permanently in one spot the availability of water becomes one of the parameters that determines their survival. Water for drinking must be reliable and potable. Water for crops must be available at the right time and in the right quantities. For the Greeks, the availability of water is itself largely determined by the Mediterranean climatic regime and the limestone-dominated geology of Greece, which allows for the formation of many subterranean sinkholes and channels.

Perpetual streams and springs are rare, with even major rivers shrinking to trickles or dry stream beds in the summer, only to become rushing torrents when the winter rains arrive. Across the millennia the Greek farmer needed to be opportunistic with regard to the use of water. Along with wells, cisterns for catching and storing rainwater are a regular feature of ancient houses, whether they stand in town or in the country. Terracing of fields is also a product of the rainfall regime of the Mediterranean climate; it simultaneously prevents erosion and ensures that more water saturates the agricultural land. Cereals must go into the ground in the winter to take advantage of the period of maximum moisture and be harvested at the beginning of the summer. Grapes, on the other hand, need the long dry weeks to ripen and become sweet. After picking, fruit that the farmer intends to dry for raisins can safely be left to bake in the open under the sun. The chances that sudden rain will ruin the harvest are slim.

The Aegean cultures were not like the “hydraulic civilizations” of Mesopotamia and Egypt which depended on the construction and coordination of a vast network of irrigation canals and dykes. Water management, whether rural or urban, tends to be small-scale and locally controlled. A simile from Homer’s *Iliad* (21. 257–59) gives a vivid picture of the typical irrigation technology of ancient and medieval Greece:

as a man running a channel from a spring of dark water guides the run of the water among his plants and his gardens with a mattock in his hand and knocks down the blocks in the channel

An important exception to this rule can be observed through the history of Lake Copais in Boeotia. Historically, it was more of a swamp than a continuous expanse of water, waxing and waning with the seasons. The ancient Greeks believed that the Minyans, a legendary people of the heroic age, had drained the water and turned it into arable land. When drainage operations were begun in the late 19th century, the truth behind the tradition was revealed. The lake had been drained in Mycenaean times by a series of canals and earthen dykes, reinforced by Cyclopean masonry, which conveyed the water to natural fissures in the earth. Perhaps this work was overseen by the rulers of the citadel of Gla which overlooks the Copaic plain. There were attempts at drainage in classical and Roman times, but none was carried through to completion. Even the modern efforts were not completed until well into the 20th century.

If the Mycenaean rulers were capable of envisioning and carrying out the draining of the Copaic basin, it should not be surprising to find that they had a sophisticated infrastructure for providing for the water needs of the palaces and surrounding settlements. Large populations living in close quarters had to be provided with drinking and washing water, while waste water and sewage had to be drained away from areas of habitation. In this technology, as in so many other things, they borrowed heavily from their Minoan predecessors.

Given the high level of luxury and elegance in the palace of Knossos, it should come as no surprise that much care and ingenuity were devoted to the area of personal hygiene. This is seen most strikingly in the suite of rooms known as the Queen's Megaron. Besides the bathroom proper, furnished with a soaking tub, there was a separate chamber with an elaborate system of interconnected cisterns, drains, and sewers. This running water was apparently used for a lavatory and, perhaps, a shower (Pendlebury, 1933, p. 52). At one of the outbuildings of the palace complex, dubbed the Caravanserai, there were provisions for travellers to wash their feet and bathe in tubs filled with water heated by wood fires. Even at this level of society, however, water was not wasted: the water from the footbath flowed out into a drinking trough for animals.

Mycenaean palaces and towns have produced evidence of aqueducts and public drainage systems. The most impressive Mycenaean water projects date from the late 13th century BC. This was a time of increased fortification at major citadels such as Mycenae and Tiryns. If, as seems likely, the rulers of these towns felt the need to prepare to face external threats, their efforts to secure the water supply can be seen as part of that preparation. At Athens, Tiryns, and Mycenae

tunnels or passages were opened to secret springs, so that they could be reached even in the event that the city walls were besieged. Despite all these precautions, the Mycenaean civilization collapsed in the 12th century BC. With the administrative structure of the palaces gone, the Mycenaean drains and aqueducts fell into disrepair.

The depopulation and devolution of the Dark Ages saw the loss of many of the technological achievements of the preceding centuries. Although people may have been aware of the principles behind the construction of systems for water transport and drainage, there seems to have been little incentive and/or logistical support for carrying out such projects. This situation changed in the Archaic period when many Greek cities were ruled by tyrants. Dependent on popular support in their conflicts with aristocratic factions, these despots often undertook major public works projects for the improvement of their cities. In the late 6th century BC Polycrates, the tyrant of Samos, was responsible for what Herodotus would later call three of the greatest feats of building and engineering in the Greek world: the great temple of Hera, the island's artificial harbour and breakwater, and a tunnel driven straight through a mountain to bring water to the city.

This tunnel, called the tunnel of Eupalinus after its architect, was inspired by the same desire that we saw in the Mycenaean citadels: to provide the city with a hidden and secure water source in times of siege. What sets Eupalinus' achievement apart is that he drove his tunnel straight through a mountain for approximately 1 km. Even then the water had to be brought from its source more than 800 m away through an underground conduit. Water did not flow through the tunnel itself, but through a covered conduit that ran below the level of the tunnel floor and at a steeper gradient. It is not known whether this secondary excavation was part of the original plan or was added when it became clear that the slope of the tunnel was inadequate to maintain the flow of water. How exactly the line of the tunnel was laid out and followed with such remarkable accuracy by the workmen is another mystery (Goodfield, 1964).

Although none of the other tyrants attempted anything so grandiose, many of the famous fountain houses of antiquity had their first architectural elaboration in the 7th and 6th centuries BC. For the ancient Greeks, even natural springs had an aura of sanctity about them because of their importance and rarity. Obviously a settlement could not be contemplated where there was no source of water, but the built-up area might be some distance from the spring itself, perhaps because of concerns about contamination. Transporting the water to a more convenient location became an objective. Pisistratus of Athens, for example, laid an aqueduct that ran into the Agora, as well as building Athens' famous nine-spouted fountain called

Enneakrounos. The location of this fountain is still uncertain, although a contemporary fountain house was found in the southeast corner of the Agora.

Archaic and Classical fountain houses tended to be relatively simple. The first modifications to the natural spring might be simply to carve out a basin or storage cisterns from the surrounding rock. After that came the roofing over of the cisterns, and then the construction of a columnar porch under which the people drawing water might stand. Other amenities might be a parapet on which to rest one's jar, or a spout to fill it. Fountain houses, along with government buildings, a theatre, an agora, etc. were among the marks of a polis, according to Pausanias. This public supply of water had several advantages over what might be available in private homes. Well water, though fresh, was difficult to draw up and might disappear in times of drought. Runoff water was collected and stored in underground cisterns, but was used for purposes other than drinking if at all possible. By bringing water from the fountains, women (and it was almost always women who performed this task) got better-quality drinking water as well as a chance to meet friends. Many depictions on vases make it clear that going to the fountain house was a time for socializing.

Classical cities, by the end of the 6th century BC, also had provisions for draining away storm and waste water. These sewers ran in large channels through public open spaces and in smaller pipes beneath the streets of residential areas. Private houses were equipped with a small room holding a drain leading into the sewer lines. By the 4th and 3rd centuries BC, Greek latrines progressed to wooden benches or terracotta seats. Bath tubs were still free-standing containers without drainage holes, so drawing and emptying a bath must have been tedious work. Public baths had individual tubs which in some cases were filled by running water from a channel that ran by them at shoulder height. These baths were connected with gymnasia or shrines of Asclepius and thus generally for the use of men only (Crouch, 1993, pp. 26–29).

Aqueducts, fountains, and baths from the Roman period show a much higher degree of elaboration than earlier structures. Roman rule brought an end to endemic warfare, so it was possible to run above-ground aqueducts for great distances without fear of exposure to enemy forces. Large public baths open to both sexes are a prominent feature of Roman urbanism throughout the provinces. During this period fountains become *nymphaea* – ornate, usually multistorey constructions which were only secondarily places to get water. With their sculptural decoration, multiple fountains and pools, and rich materials they existed mostly as a stage for the display of the interplay of light, water, and stone which is such a hallmark of the architecture

Women

There is little certain information about women in Bronze Age Greece and Crete so that most of our knowledge of them during this period is speculative. The two main sources of information are art and the Linear B tablets.

While feminine figures play an important role in both Minoan and Mycenaean art, their identity is not clear. They may be goddesses, priestesses, nobility, or common women. It appears that in many instances females portrayed in Bronze Age Aegean art are goddesses. Feminine statues are shown adorned with snakes, birds, or floral motifs, often with arms upraised in a possible pose of prayer or benediction (the "Goddess with Upraised Arms"). One small ivory figurine from Mycenae shows two women seated together with a small child on the lap of one of them. Some scholars have interpreted this as an early portrayal of Demeter, Persephone, and Plutus. In glyptic art, especially from Crete, females are shown in the centre of outdoor

religious scenes, often engaged in dances. Women were represented in the frescos that adorned houses and palaces. In some instances they are depicted gathering crocuses in idyllic scenery, while in others they are shown socializing in the company of men. In Crete they participate in scenes of ritual procession, while one fresco from Mycenae shows two females together driving a chariot.

Linear B texts, while fragmentary and of a “shopping list” nature, give clearer glimpses into the everyday lives of women: they appear as queens (*wanassa*), priestesses (*hiera*), landowners, temple servants, and slaves. While only the surface of the roles of women in Linear B has been scratched, it appears that on the Greek mainland a patriarchal system was already in place. Among women, only religious functionaries owned land. Conversely, texts from Knossos in Crete show women owning fruit orchards independently of men, possibly indicating their higher status in the wake of the Minoan civilization. In both regions female slaves were common, usually identified by a proper name and the land of origin. This may be indicative of the seizure of women as war booty as portrayed in Homer’s *Iliad*.

Beginning with Homer and Hesiod, literary and historical texts and art provide information concerning the lives of women in the historical period. Unfortunately, most of these texts and images were rendered by men, and thus they offer a view of women from the male perspective. While women had extremely limited political and economic powers, they played active roles in the cultural life of ancient Greece. Prominent literary names that have survived are of the poets Sappho of Lesbos (6th century BC) and Telesilla of Argos (5th century BC).

Women were most active in the religious life of the polis. The two most important fertility rites, the Thesmophoria and the Skirophoria, were administered solely by women. Since the former was a three-day-long affair involving all Greek women (except virgins – Callimachus, fr. 63), it is evident that considerable planning was involved, all controlled by women. In Aristophanes’ *Lysistrata* (640ff.) the chorus of women recounts bearing the basket in the Arrhephoria, milling flour for the Athenaion festival, “playing the bear” for Artemis at Brauron, and serving as basket-bearers in the Athenaion festival. While such roles were often reserved exclusively for the upper classes, other important religious positions were not. The priestess of Athena Nike on the Athenian Acropolis was chosen by lot from the female population of Athens. For her services she received an annual salary of 50 drachmas and the hides and legs from the public sacrifices. On the more human side of religion, literature and art show that it was women who were responsible for the care and remembrance of the dead. Women prepared corpses for burial, were the chief mourners

during funeral processions, and brought offerings of garlands and funerary libations to the dead after burial (*Choephoroi*).

Beyond religious duties, women's lives consisted of marriage and motherhood, textiles, and household management. The clearest picture of household life comes from Xenophon's *Oeconomicus* and Lysias' *Murder of Eratosthenes*. Combining the two, a picture of married life emerges. The woman is married very young to an older husband chosen by her parents. Once married, she cares for the organization of the household, spinning and weaving, and, in the case of more affluent brides, supervises the household slaves. Women wore lead cosmetics to make themselves appear pale, the ideal shade for those expected to remain indoors. They travelled outside the house for religious events, funerals, and to meet neighbours. These forays outside the home were viewed with suspicion by men, who were apparently in chronic fear of adultery (*Ecclesezusae*). Lower-class women also worked outside the home (Demosthenes, 57. 31–35; *Thesmophoriazusae*, 446–52). Between the “respectable” and working classes were the *hetairai* (courtesans), the most famous of whom were Aspasia, Neaira, and Lais.

From the end of the 5th century BC into the 4th, women's lives became increasingly constricted. Pericles claimed that the best that could be said of any woman was that her name was never mentioned in public either for praise or blame (Thucydides, 2. 45). In the 4th century BC gynaecology, and thus women's bodies, fell increasingly into the hands of male doctors, while philosophers such as Plato ascribed the roles of midwife and mother to males and their progeny of the mind.

In the Hellenic period, while many general aspects of life such as religion and motherhood remained the same, women of all classes made greater contributions to politics, culture, and society than previously, and women experienced greater freedoms than at the end of the Classical period. In the aristocracy, women ruled as queens, either side by side with their consorts or independently. Notable at the head of dynasties were Olympias, queen of Macedon and Alexander's mother; Berenice II (3rd century BC), queen of Cyrene and Egypt; queen Arsinoë of Egypt (c.270 BC); and Cleopatra VII (1st century BC), queen of Egypt and final monarch of the Hellenistic dynasties.

Nonroyal women also enjoyed social, legal, and economic benefits in the Hellenistic age. In the 2nd century BC a woman called Archippe was publicly honoured in Cyme (Asia Minor) for financial contributions made to the polis (Pleket, no. 3), while an inscription from Histria records the existence of a female archon (ibid., no. 2). In the 1st century BC Phile of Priene held the office of *stephanephoros* (“garland bearer”) for building, at personal expense, the city aqueduct

and reservoir (*Inscriptionen von Priene*, 208). Economic independence, if not wealth, was possible for lower-class women. Documents preserved from Egypt reveal: a marriage contract sworn between Heraclides and Demetria to regulate their claims to property and means of redress in case of violation (*P. Elephantine*, I); a lawsuit enacted by Philista, “a working woman”, in a case of personal injury (*P. Enteuxis*, 82); and the complaint of one father whose daughter Nike was expected to support him financially through her labour (*ibid.* 26).

In the cultural sphere, this was the age of the female intelligentsia. Poets such as Erinna (4th century BC) and Nossis (3rd century BC) were likened to Sappho (Antipater, 9. 26), while Aristodama of Smyrna was made *proxenos* (“patroness”), citizen, and benefactor of Lamia for her verses (W. Dittenberger, *Sylloge Inscriptionum Graecarum*, 1915–24, 3. 532). Anyte of Tegea, among other works, wrote epigrams for dead maidens, noting their wisdom as well as their beauty (*Anthologia Palatina*, 7). Some women became painters, with Laia of Cyzicus renowned as the finest portrait painter of her day (Pliny, *Naturalis Historia*, 35. 147ff.). In philosophy, women studied at Plato’s Academy (Diogenes Laertius, 3. 46, 4. 2, 6. 96ff.), while in the 4th century BC women began formal practice of medicine (Hyginus, *Fabula*, 274. 10–11).

Women’s Cults

In antiquity women played a significant role in religion, and the existence of female divinities in the Greek pantheon has led many scholars to investigate further the relation between mortal women and their gods and goddesses. Some cults were exclusively practised by women, whereas in others women participated by fulfilling certain roles. Not surprisingly, many women’s cults were closely associated with female divinities.

The Brauronia, originally a local festival at Brauron in Attica,

became associated with the goddess Artemis. Girls between 5 and 10 years of age were sent by their mothers in procession to Artemis, the eternal virgin goddess. Artemis is also connected with childbirth, and therefore many women's cults are related to her. According to evidence from Plutarch (*Aristides*, 20. 6), young women would make premarital offerings to Artemis, a goddess associated with transition in a woman's life. Women participated fully in cults that honoured Demeter. Besides the Eleusinian mysteries the festival of Thesmophoria was widely celebrated among women, who performed fertility rites. The festival took place in the autumn and was open to women only. Demeter, together with her daughter Persephone, and Dionysus were worshipped at the festival of Halosia in December. Demeter, the goddess of grain, was often worshipped with Dionysus, the god of wine. In Arcadia she was worshipped with Poseidon. In later times she was syncretized with Gaia and Rhea, or Cybele.

Women played an important role in civic festivals. In the Panathenaia they were the ones who wove and presented the *peplos* (a special embroidered robe) to Athena, and on the night before the procession that held central place in the festival they performed ritual cries and choral dances. The Athenian festivals occurred in early and midsummer in the following order: first the Plynteria and Kallynteria (cleansing and beautifying festival), then the Skira (threshing festival), and finally the Panathenaia. The Arrhephoria was a mystic festival in honour of Athena that took place in midsummer parallel to the Panathenaia. Four girls of noble families had to spend some time at the temple of Athena: two of them had to present to the goddess the *peplos* that the women had woven, and the other two received coffers from the priestess, the contents of which could not be revealed, and carried them in the great procession.

Many women's cults had a strong local element, such as the cult of Hera, the goddess of marriage and domestic life, in places like Argos and Samos. The cult of Dionysus was particularly associated with women. Dionysiac orgies were celebrated on Mount Parnassus by cult associations of women, and were later incorporated in the cult of Apollo at the same place. In later times, especially in Hellenistic Alexandria, women performed lamentation rites for Adonis after the celebration of the wedding of Adonis and Aphrodite. The Adonia was also celebrated in Classical Athens in the spring. Rituals of incubation, like those connected with Asclepius, were also popular among women, but were not exclusive to them.

Women also played an important role in official and mystic cults as priestesses. (It should be noted that there was no such thing as a caste of priests or priestesses.) Many priesthoods were filled by women only, mainly for the cults of goddesses. There were various rules as to

the status and age of a priestess. The priestess of Athena was a married woman, whereas virginity was required for priestesses of Hestia. Pythia was the name given to the priestesses of Apollo who played an important role in Greek history by giving the oracular response on many important public and private matters.

Heroines held an important position in women's cults. Various phases of life involving marriage, pregnancy, and children were associated with specific cults of heroines, the most notable being those that feature in myths around the Olympian pantheon, such as Ariadne, Semele, and Iphigeneia. The clothes of women who died in childbirth would be dedicated to Iphigeneia at Brauron, but of those who survived to Artemis. There were other cults addressed to less well-known heroines in myth, such as the celebration of Hecale in the Attic deme of the same name, a heroine mostly known from the cycle of myths around Theseus. At Olympia Pelops and Hippodameia were honoured in an agonistic setting. Last but not least comes the expression of religious feeling towards a divinity, or often in heroic cults, in choral contests as an agonistic ritual.

Woodworking

Ancient Greek carpentry is not well known because of the lack of permanently dry or permanently waterlogged conditions that favour

the preservation of wooden objects. Carpentry, moreover, is not a craft that lends itself to written description. Theophrastus wrote much on the choice and preparation of timber, but this amounts to little more than the lore which carpenters thought fit to relate to him; much of it seems to be nonsense or misunderstood.

Greek buildings were walled with stone or mud brick, but sockets reveal something of the missing timbers. Almost every building had a timber roof, often upper floors, and usually joinery (in windows and doors), none of which survive. Temple roofs could be mighty timber structures, but involved timbers merely resting on each other; internal walls reduced the span and usually made it unnecessary to use timbers more than about 10 m long. Sophisticated carpentry with tension-transmitting joints, of the kind found in Western cathedral roofs, was apparently unknown. The oldest surviving, still functional timbers are the original wooden blocks that join the column-drums of the Parthenon and prevent them from disconnecting in an earthquake. Occasional timber elements survive in Roman buildings.

Furniture, as known from vase painting, was rich and varied, at least among the well-to-do, but there is little evidence of its construction. Musical-instrument-making involved complex woodworking: a lyre, for example, was a clever piece of miniature engineering. Military equipment, especially artillery, could involve massive timber structures.

Our knowledge of Greek shipbuilding comes from underwater excavation of the wrecks of cargo ships (not triremes, which had a positive buoyancy and thus never sank). Ancient Greek shipbuilding was as complex and sophisticated as any that the world has seen. As with other ancient ships, the hull was built as a shell of planks and the ribs added later. The planks were ingeniously and laboriously joined edge-to-edge by hundreds of tenons hidden in their thickness. As in all subsequent ages, the size of ships was limited by the length of the longest tree. Timber was usually brought from a distance: it is unlikely that Greek shipbuilding was ever on a scale which used timber faster than the growth of trees could replace it.

Timber-framed building was known to the Minoans, but probably not in Classical and Hellenistic Greece. Timber-framed houses, with overhanging upper storeys and brick or stone infill, are found in parts of northern Greece and the islands. They are mainly urban – there are good examples in Siatista (Macedonia) and Chania and Herakleion (Crete) – and appear to be of the 18th and 19th centuries. In remote country districts outhouses with earth-fast posts and woven wattle walls are still to be seen. Timbers are often built into stone or mud-brick walls as reinforcement. Tile-covered timber roofs of the 19th and early 20th centuries often follow a Roman pattern; there are some

large examples on warehouses in Crete. Timber is not often a medium for architecture or decoration in ordinary houses: exceptions are house doors, and the magnificent carved and painted house interiors of the island of Karpathos.

X

Xanthus

City in Lycia

The river from which the city of Xanthus takes its name appears frequently in Homer's *Iliad* (though it should not be confused with the alternative name for the Scamander). It is where Sarpedon's kingdom is based, and where his body is taken for burial after his death.

In historical times Xanthus was the economic, political, and cultural centre of Lycia down to the Hellenistic period. Subsequently, other cities in Lycia, such as Patara and Myra, came to rival it in importance, but Xanthus remained one of the prime Lycian settlements until the general abandonment of the Lycian cities in the Arab invasion of the 7th century AD. As such, it stands as an epitome of many of the cultural developments and interactions with the Greek world that are to be found generally in Lycia; indeed, it is not unknown for ancient Greek authors to use the terms "Xanthus" and "Lycia" as if they were synonymous.

The best-known Lycian writer of the Classical period, Mene-crates, came from Xanthus. Xanthus has one of the earliest examples of sculpture executed by Greek (or Greek-trained) artists to a Lycian commission, the so-called Lion Tomb (6th century BC). The centre of the "dynastic" system of rule was in Xanthus, and it was dynasts associated with Xanthus who were the first to put their portraits on their coinage. They were also the first to use Greek inscriptionally, commissioning poets to compose appropriate lines in praise of them (e.g. the 12-line epigram on the "Inscribed Pillar" at Xanthus of the late 5th century BC, and the poems by Symmachus of Pellana in honour of the dynast Arbinas of the early 4th century BC at the Letoum sanctuary).

The national sanctuary of Lycia was the Letoum, in the territory of Xanthus. Originally this was associated with a manifestation of the Anatolian mother goddess, but later was assimilated to Leto, and so many of the traditions that associated Leto and her children with Lycia are centred upon Xanthus and the Letoum. It was probably here that Alexander was supposed to have discovered a tablet indicating that he would conquer the Persian empire (Plutarch, *Alexander*, 17. 4–5). By the 2nd century BC the Letoum had acquired two large temples, one of Leto and one of Apollo, complementing an earlier late-Classical temple of Artemis; all three temples probably replaced earlier structures.

In the Hellenistic and Roman periods Xanthus, like the rest of Lycia, became further integrated into the Greek world as a whole, acquiring many of the typical features (theatre, etc.) of a Greek polis. An example of how integrated Xanthus was is provided by a unique document of 206/05 BC (*Supplementum epigraphicum Graecum*, 1923–, 38. 1476), recording an appeal made by the Cytenians in Aetolia to the Xanthians, appealing for help from Xanthus on the grounds of mutual kinship, based on their common links with Leto.

After the abandonment of the city in the 7th century AD, Xanthus was largely neglected by westerners until the arrival of Charles Fellows in 1838. His subsequent discoveries, publications, and recovery of antiquities, though ranging through much of Lycia, centred upon Xanthus, and antiquities from Xanthus had pride of place in the “Lycian Room” of the British Museum in the 19th century. The Nereid monument is undoubtedly the most famous of these discoveries. This, commissioned probably by Arbinas as his tomb, was a podium monument, deriving from other earlier Lycian monuments (such as a now destroyed building tentatively identified as a heroon (hero-shrine) of Sarpedon), but incorporating a façade modelled after a Greek temple. It directly influenced the style of the Mausoleum of Halicarnassus, and from that much of later Hellenistic and Roman funerary architecture (and beyond). The monument’s sculptures, dancing figures usually identified as Nereids but probably Lycian deities of the dead, and reliefs showing scenes of warfare and the dynast’s court, are now held up as typical examples of Greek sculpture of the early 4th century BC, and the Nereid monument has pride of place in the British Museum second only to the Parthenon marbles.

Xenophon c.430-c. 355^{BC}

Athenian soldier, philosopher, and historian

Unrivalled in the ancient world for the breadth of his personal experience and the originality of his writing, Xenophon was important to subsequent ages as a Socratic philosopher and an heir to the legacy of Thucydides; as a prose stylist he was central to the Atticist and, later, the Byzantine canons.

Born into a wealthy family during the early years of the Peloponnesian War, he probably saw combat late in the conflict. In his early years he became associated with the circle of individuals who admired Socrates. His aristocratic background, association with Socrates, and an eyewitness feel in the relevant portions of the *Hellenica* encourage the view that he was involved in the government of the Thirty Tyrants immediately following the war (404–403^{BC}). In the spring of 401^{BC} he joined the Greek mercenary contingent of the army of Cyrus the Younger, who was attempting to usurp the Persian throne. Following Cyrus' death at the battle of Cunaxa, and the later abduction and murder of the commanders of the Greeks, Xenophon emerged as an important leader. When the mercenaries were absorbed into the Spartan army operating in Asia Minor, Xenophon was as well, and he remained there for the next five years. With the outbreak of the Corinthian War in 395^{BC}, Xenophon returned to Greece in the company of the Spartan king Agesilaus; he seems to have witnessed first-hand the battle of Coronea (394^{BC}). Either because of his presence in the Spartan ranks at Coronea, or because of his service with Cyrus, or perhaps both, he was exiled from Athens during this period. Thanks to his Spartan connections, he was granted an estate at Scillus near Olympia (recalled by Leake, 1830, 2. 86), where he lived until Spartan control of the north Peloponnese collapsed after the battle of Leuctra in 371^{BC}. Although a return to Athens cannot be ruled out (his exile was at some point revoked), he probably lived out his last years in Corinth. He was married and had two sons, one of whom (Gryllus) was killed in combat before the second battle of Mantinea (361^{BC}). Xenophon died soon after 355^{BC}.

Xenophon's corpus can be divided into three parts: historical, philosophical, and technical treatises. He wrote up a history of the Greek world from 411 to 362^{BC} that was known in antiquity as the *Hellenica*; it is in part a continuation of Thucydides' unfinished history of the Peloponnesian War, but takes events down through the Corinthian War, the hegemony and collapse of Sparta, and the rise of Thebes. The *Anabasis* is his account of the march of the 10,000 Greek mercenaries in the service of Cyrus the Younger. The *Cyropaedia* is a quasi-historical work that is in part a proto-novel; it treats the

education and life of Cyrus the Great, the founder of the Persian royal house (the Achaemenids). Xenophon also contributed one of the very first biographies in ancient Greek literature, the encomium of his friend king Agesilaus. So far as his philosophical writings are concerned Xenophon is an important figure in the Socratic tradition. In addition to rivalling Plato with an *Apology* and *Symposium*, he wrote up a set of anecdotal remembrances of Socrates known as the *Memorabilia*. Further, Socrates also plays an important but subsidiary role in a work entitled the *Oeconomicus* (Household Management). The *Hieron* is a dialogue that features the tyrant of that name conversing with the poet Simonides on the topic of absolute power (Socrates is not present). Xenophon also wrote a number of smaller, technical works: *Revenues*, the *Cavalry Commander*, *On Horsemanship*, and *On Hunting*. A *Constitution of the Athenians*, traditionally attributed to the “Old Oligarch”, was also included in the works of Xenophon in antiquity, but is clearly not by him.

As a participant on the famous *anabasis*, as well as an observer of Greek internecine strife in the years that followed, Xenophon had experience of Panhellenism at first hand, yet he also had a more practical understanding of it than a figure such as Isocrates; while passionately devoted to the principle of an alliance of all the Greeks and the cessation of hostility between Greeks, he also recognized that war was a constant feature of Greek political life. Later historians such as Polybius (2nd century BC) and Arrian (c.AD 90–160), who were in a position to make comparisons with the forces of Philip and Alexander, saw the 10,000 in particular as a precursor of the Macedonian army that was to bring to reality dreams of Panhellenism. Arrian, for his part, even considered himself a “second Xenophon”, and the title of his account of Alexander’s conquests is telling: the *Anabasis of Alexander*. The great orator Dio Chrysostom (1st–2nd century AD) modelled his writing on that of Xenophon. Indeed, Xenophon was widely regarded as the “Attic Muse” for the sweetness of his style (see e.g. Cicero, *Orator*, 32), and was an important model for Atticist writers, even though modern studies have revealed that his work contains many non-Attic features. Xenophon of Ephesus, the novelist of the 2nd century AD, is in fact probably a nom de plume for a writer working in the tradition started by the *Cyropaedia*.

For many in antiquity Xenophon was first a philosopher and second a historian: as Quintilian says in his list of Greek and Roman historians, “I have not forgotten Xenophon, but I think he ought to be included among the philosophers” (*Institutes*, 10.1.75). His picture of Socrates is fundamentally different from the man we see in Plato: in Xenophon, Socrates is much more a sage interested in the practical issues of day-to-day living, from self-control to the proper training for

public life, and to the ordering of the household; his piety is also a common theme. The choice of Heracles between virtue and vice from the *Memorabilia* became a popular subject in later thought and art. The story of Xenophon's first encounter with Socrates was also widely treated. He was an especially popular author with the Romans, in particular with figures such as Cicero (see, for example, his *Oratore*, 2. 58).

In late antiquity Xenophon's influence diminished somewhat: the pagan Libanius (4th century AD) read him, as did the Church Fathers Basil and John Chrysostom, but the former knew him only indirectly (the choice of Heracles story). In the early Byzantine period his importance was reestablished, in particular as a historian-soldier and prose stylist: the historian Agathias relies on him, as does the Constantinian excerptor later. For men of state who were also writers such as Nikephoros Bryennios (11th–12th century), husband of Anna Komnene and pretender to the throne, he was an especially important model. Manuel II Palaiologos (1391–1425) quotes from his work. Xenophon was among the first ancient Greek authors translated into Latin in the Renaissance, during the papacy of Nicholas V (1446–55). In the modern period his role as commander of the 10,000 was especially cherished: so, for example, the great klepht commander Androutsos (d. 1798) led his men on a march that was popularly compared with the *Anabasis* of Xenophon.

Biography

Born c.430 BC, Xenophon associated with Socrates in his youth and may have fought at the end of the Peloponnesian War. He was involved in the government of the Thirty Tyrants (404–403) in Athens. In 401 he joined the army of Cyrus the Younger as a mercenary. After Cunaxa (401) Xenophon led the surviving forces back to Byzantium. He then fought for Sparta at Coronea (394) and was exiled from Athens. He was given an estate near Olympia but after Leuctra (371) moved to Corinth where he died c.353. His writings include historical and philosophical works and technical treatises.

Z

Zeno of Citium 335–263_{BC}

Stoic philosopher

Zeno was the founder of Stoicism, a philosophical movement that had a great impact in the Greek and Roman world of the Hellenistic and imperial age. Stoicism was named after the place where Zeno used to teach in Athens, namely the Stoa Poikile (Painted Porch). Zeno, a Phoenician, came to Athens around 313_{BC}, and he studied first with Crates the Cynic, then with Stilpo and Diodorus of the Megarian school, and finally with Xenocrates and Polemo of the Academy. He had many students and he was well respected by the Athenians and also by Antigonus Gonatas who often attended his lectures and invited him to his court. His successor in the headship of the Stoic school was Cleanthes, but the most important contribution to Stoicism came later from Chrysippus. From Zeno's numerous writings we have only fragments from much later sources such as Cicero (1st century_{BC}), Diogenes Laertius (2nd century_{AD}), Galen (2nd century_{AD}), and Stobaeus (5th century_{AD}). Famous was his *Republic*, where he argued for a society of the wise who do not need the conventional institutions of a Greek city. The fullest account of his life and his doctrines comes from Diogenes Laertius (7. 1–160).

Zeno is accredited with the tripartite division of philosophy into logic, physics, and ethics. He is said to have started his course with logic, going on to physics, and finishing with ethics. Zeno's prime interest lies in ethics, but this interest motivated a physical enquiry and then an enquiry into logic. Yet all these parts are seen as part of an organic and coherent whole and thus none of them can be studied independently. Zeno's holistic understanding of philosophy results from his attempt to establish a system accounting for all aspects of a coherent and rational universe; reason (*logos*) and nature (*physis*) are the most crucial concepts for the Stoic understanding of the world.

Zeno put considerable emphasis on dialectic which included epistemology. He attempted to argue for the possibility of attaining cognition, an epistemic state midway between belief and knowledge. He argued that to know something is to have grasped it in such a way that one's grasp (*katalepsis*) cannot be shaken by argument. This grasp presupposes perception. Perception strikes our rational principle and generates impressions (*phantasiai*). Nature endowed us with the ability to form impressions of things, and impressions form the content of our mind – actually, rationality develops through them. Thus perception

constitutes for Zeno a mental act to which we can give assent. But not all impressions deserve assent. An impression deserves assent if it represents something as it is in reality, namely in such a clear way that it cannot possibly be false (Cicero, *Academicae Quaestiones*, 1. 41). These are cognitive impressions, i.e. they can convey knowledge. Zeno sharply contrasted secure assent (grasp) and weak assent, the latter amounts to ignorance. Yet a cognitive impression does not amount to knowledge; it still has to be confirmed by reason. For Zeno whatever does not qualify as knowledge amounts to ignorance. Accordingly he divided people into two categories, the foolish and the wise, the latter being the only one who knows. No intermediate state exists; unless someone is wise, he is foolish.

Zeno argued for two principles in the universe, the active and the passive. The passive principle is the qualityless (*apoiós*) substance, the matter, while the active is the *Logos* in that which is called God (Diogenes Laertius, 7. 134). The whole of the universe is perfect, though destructible and subject to no other force but to itself. It was one of Zeno's fundamental ideas that every productive cause is corporeal and that only corporeal things can act. Thus mind and even God, the active principle, are corporeal. God, identified with fire, is the disposer of the things of nature and maker of the universe; it is also called reason and fate and is the determining force of all things. Zeno's account of nature is strongly teleological and his universe is very determinist; nothing happens in the world but by God's will and in accordance with God's providence. Fate not only governs everything but is defined as the reason by which the world goes on. For this reason divination is possible and can be true.

The world is considered to be a rational and intelligent being, a living organism with its own soul just as man has a soul. Human souls are fragments of the universal soul, man being an organic part of the cosmic whole. Zeno maintained that both the universal soul and the human soul are corporeal, a warm spirit (*pneuma*), which is the vitalizing force behind both humans and the universe itself. Soul has eight parts, the five senses, the faculties of reproduction and speech, and the rational principle (Diogenes Laertius, 7. 157). As the term of the rational principle suggests (*hegemonikon*, "governing principle"), there is nothing superior to this but this alone determines human life, even when it follows wrong reason. Zeno introduced some new terms to describe psychological or mental functions that take place in the rational principle such as "impulse", a soul's movement as a reaction to an impression. Man is free to follow an impulse by giving assent to an impression.

Zeno thought that philosophy had to show its fruits in ethics. According to Zeno, our goal is to live in accordance with reason, later

formulated as living in accordance with nature. The law of nature can guide a man unerringly to virtue. Zeno maintained that virtue is something pertinent, endearing (*oikeion*) to the nature of man in the sense that nature directs man towards the acquisition of virtue. Therefore man should seek after virtue. In seeking virtue man is doing justice to its nature (*oikeiosis*), and being virtuous is a manifestation of one's rationality. Zeno held that only virtue has intrinsic moral value since only virtue is up to us. Therefore virtue is the sole good and the sole constituent of happiness. All other things, however good or bad, are regarded as morally indifferent (*adiaphora*). Within the group of indifferent Zeno distinguished three classes, the preferable, the non-preferable, and the indifferent. Natural advantages such as beauty and wealth are preferable. Accordingly Zeno distinguished between appropriate and perfectly appropriate acts; the first refer to preferable things, while the latter to morally valuable ones. Virtue is said to be one; individual virtues are inseparable and they constitute a state in which their possessor would always do the right thing. The smallest failure makes somebody unvirtuous. To be virtuous is the achievement of the wise man. As is the case with knowledge, so in ethics Zeno does not allow for any degrees of goodness. The wise man never fails in practising virtue, because of his acquired moral expertise; thus the wise man is free from all passions that would have a bad impact on his soul (Cicero, *Academicae Quaestiones*, 1. 39).

Zeno's doctrines were considerably modified by his successors. Yet he enjoyed a venerable status as the founder of the school. Later Stoics such as Posidonius (1st century BC) opposed their predecessors and tried to go back to Zeno's views. Stoic doctrines had an impact on Christian Fathers who shared the Stoic hostility to sceptics and Epicureans. Clement of Alexandria (c.AD 150–215) is likely to have had access to Zeno's writings, which by that time must already have become difficult to find.

GEORGE E. KARAMANOLIS

Biography

Born at Citium in Cyprus in 335 BC, Zeno moved to Athens in 313 to study first under Crates the Cynic, then with Stilpo and Diodorus, and lastly with Xenocrates and Polemo of the Academy. He was founder and head of the Stoic school of philosophy. He was succeeded by Cleanthes. Only fragments of Zeno's writings survive. He died in 263 BC.

Zoology

It would not be entirely true to say that no Greek philosopher before Aristotle took an interest in the animal kingdom. Anaximander in the 6th century BC had speculated on the origins of animal life; Empedocles had included animals in his account of the cosmic cycle; and the Hippocratic treatises show some interest in the systematic study of animals in the context of their therapeutic value. None of this, however, shows signs of any but the most superficial observation. Democritus the atomist is credited with a treatise on zoology, but we have no idea what it contained; reports that survive, largely in the works of Pliny, consist of no more than disconnected anecdotes, without a context (indeed it is sometimes doubted whether Pliny's Democritus is the same as the philosopher). Plato's method of division embraces the classification of animals, but they are mentioned hardly at all in his surviving works. His successor Speusippus wrote a work called the *Homoia*, or Similarities, on defining classes on the basis of characteristics that individual members have in common, and he seems to have included animals in this process, but we know little about the work.

The fact that Aristotle, the author of the first surviving zoological treatises, feels the need to defend the study of animals (*On the Parts of Animals*, 644b22–646a4) gives a clue to reasons for the comparative neglect of this field. The imagined objectors against whom he directs his defence (presumably Platonists) regard animals as insignificant and distasteful, and are shocked by the prospect of the unpleasant task of dissection. They prefer the study of grander themes such as astronomy and cosmology, whose subjects are unconditionally beautiful and which admit of a degree of precision and absolute truth

not possible in the study of the messier works of nature. Aristotle counters by pointing out that, lowly though they are, animals are at least accessible to close and detailed observation (unlike the heavenly bodies), and argues vigorously that all of the works of nature show purpose, and contribute to an end, and for that reason are intrinsically beautiful.

Five principal zoological treatises of Aristotle survive: *The History of Animals*, *On the Parts of Animals*, *On the Reproduction of Animals*, *On the Motion of Animals*, and *On the Progress of Animals*. They are, by any standards, remarkable works. Between 500 and 600 different kinds of animals are discussed, sometimes in considerable detail. There is clear evidence of the systematic collection of data throughout Aristotle's career. Place names mentioned suggest that he was already gathering information in northwest Asia Minor and on Lesbos, which he visited in the period between leaving the Academy in Athens and becoming the tutor of the future Alexander III of Macedon. There is no positive evidence from Aristotle's own works to support the suggestion that is sometimes made, both in antiquity and by later writers, that Alexander sent Aristotle interesting specimens gathered as he travelled east into the Persian empire. Nevertheless, the story should not be dismissed out of hand. For example, Aristotle is exceptionally well informed about the diet, capacities, habits, and anatomy of the domesticated elephant, and it may well be that reports on the animal had been sent to him in the course of Alexander's campaigns in the east. Elsewhere, much of his information seems to have been derived from questioning fishermen, herdsman, beekeepers, and travellers, among others. What is more, there are clear signs that Aristotle dissected a good number of specimens (or at any rate had access to reports of such dissections). He is credited with a work on dissection (now lost), and his extant works contain frequent references, not only to the results of dissection, but also to the technical problems involved (for example, he was aware that an animal killed by having its throat cut will not have its circulatory system in a normal condition, and recommends strangling instead; but his belief that the heart has three rather than four chambers suggests that his own technique may have been just as unsatisfactory). For the most part, however, the care and meticulousness of the observations are very impressive. For example, he describes in detail the development of a chick inside an egg (*The History of Animals*, 561a4–29): after three days, he says, the embryo of the chick can already be seen; later the parts of the body can be distinguished – first the heart and veins, then the head and the eyes; by the tenth day the chick itself is clearly distinguishable (and he describes what can be seen if one of the eyes is dissected); finally, the chick is ready to hatch on the twentieth day. This series of

observations could have been made only as the result of a deliberately planned programme of investigation. One of the best known of his systematic descriptions is that of the reproductive system of the dogfish. This fish, like a number of other closely related fishes, bears live young, but Aristotle reported that it is unusual in that before birth the embryo is attached to its mother by a structure similar to the navel-string and placenta in mammals. It was only in 1842, after centuries of scepticism, that it was confirmed (by Johannes Müller) that Aristotle's account was essentially correct.

Impressive though this is, Aristotle is by no means infallible, and his works contain numerous mistakes. Some seem to be the result of simple observational error (such as his belief that a lion's neck contains only one bone, or that the heart has only three chambers). Sometimes, he seems to have been misled by fanciful travellers' tales (such as the report that hares invariably die if they are imported into Ithaca, or that the bite of the gecko is fatal in Italy). More significantly, he sometimes misleads himself by the inappropriate application of general principles, as when he argues that worker bees are neither male nor female, on the grounds that no female animal has defensive weapons (and worker bees have a sting), and no male animals care for their young (as worker bees do). Applying the same principles to queens (or "kings", as Aristotle calls them) and drones, he concludes that all three kinds of bee reproduce parthenogenetically, from their own kind. It must, however, be said, in Aristotle's defence, that the task of sexing a bee, using the resources he had available, would be by no means an easy one.

It is not at all clear what Aristotle thought was going to be the end result of his zoological researches. Although there is certainly evidence of systematic collection of material, the actual arrangement of the pieces of information in his zoological works shows no obvious system; facts are roughly grouped together by topics, but the structure of the classification remains obscure. It is too easy to assume that Aristotle was aiming at the sort of classification of animals that biologists, following Linnaeus, achieved from the 18th century onwards. Though Aristotle's work can undoubtedly be regarded as the foundation on which later scientists built, it may well be that his own purposes were quite different from theirs, and that his collection of zoological facts was actually intended to be the raw material for his study of the purposive working out of nature's goals, or for an exercise in putting into practice his logical theories. Even so, the quality of his empirical investigations remains impressive, and without precedent until modern times.

After Aristotle, his pupils and associates continued with his work (and indeed it is likely that many of Aristotle's zoological treatises

were themselves the result of collaborative work). His successor Theophrastus wrote *On the Character and Intelligence of Animals*, and a number of other works on the behaviour of different classes of animal, all of which have been lost. One short zoological work of Theophrastus, however, *On Fish*, does survive. It deals with the apparent anomaly of fish and other sea creatures which can sometimes be found surviving on dry land, or may even be dug up out of the ground, and shows evidence of careful observation of a variety of species. Theophrastus' successor as head of the Lyceum, Strato of Lampsacus, is also credited with works on zoology.

In the Hellenistic period some physicians (Herophilus, for example) seem to have taken an interest in comparative anatomy, and the surgeon Sostratus (1st century BC) is credited with the books *On Animals*, *On the Nature of Animals*, and *On Animals Which Sting and Animals Which Bite*. Dissection of animals later became a standard tool of medical research, but the real centre of interest is the human being. The same can be said of later writings on animal behaviour, which was of interest only in so far as it illuminated or provided models for human behaviour. Epicurus, for example, cited the alleged fact that animals invariably seek pleasure and avoid pain as proof that hedonism is natural (and his opponents the Stoics used animal examples to assert the opposite). Similarly, Plutarch investigated the question of whether animals are capable of exercising reason. This tradition was continued by Christian writers such as Origen and Basil of Caesarea, who used reports of animal behaviour derived from Aristotle and other Greek writers to illustrate moral arguments and as symbols representing theological positions.

The *Natural History* of the Roman writer Pliny the Elder contains a mass of facts about various animals, treated mostly as interesting curiosities without serious attempts at classification, and the same can be said of *On the Nature of Animals* and *Varia Historica* of Aelian. Both draw extensively on the writings of earlier Greek zoologists (indeed, more than two-thirds of Pliny's sources are Greek). The ultimate source of much of their information seems to be Aristotle himself, but these later writers seem not to have consulted his texts (or those of other authorities such as Theophrastus) directly, but to have used collections of excerpts (such as that of Pamphilius), summaries (such as that of Aristophanes of Byzantium), or works which are heavily dependent on earlier sources (such as Alexander of Myndos's *On Animals*). In other words, their works are in no way empirical studies, but are purely literary compilations drawing on reference works. It is in fact this moralizing and anecdotal tradition of zoology that passed on into the Middle Ages; it was only with the scientific revolution of the 17th century that Aristotle's systematic studies became the

foundation of modern zoology.

Notes on Advisers and Contributors

Anderson, Michael J. Assistant Professor of Classics, Yale University. Author of *The Fall of Troy in Early Greek Poetry and Art* (1997). Contributor to *Journal of Hellenic Studies* and *Classical Philology*. **Essays:** Achilles Tatius, Bacchylides.

Arnautoglou, I.N. Researcher, Academy of Athens, Research Centre for the History of Greek Law. Former Assistant Editor of *Lexicon of Greek Personal Names*. Author of *Ancient Greek Laws* (1998). Contributor to *Cosmos* (1998) and to the journals *Zeitschrift für Papyrologie und Epigraphik*, *Ancient Society*, *Journal of Juristic Papyrology*, and *Revue Internationale des Droits de l'Antiquité*. **Essays:** Adoption, Law.

Ash, Rhiannon. Lecturer, Department of Greek and Latin, University College London. Author of "Severed Heads: Individual Portraits and Irrational Forces in Plutarch's *Galba and Otho*" in *Plutarch and His Intellectual World*, edited by Judith Mossman (1997) and *Ordering Anarchy: Leaders and Armies in Tacitus' Histories* (1999). **Essays:** Appian, Cassius Dio, Nero, Plutarch.

Asheri, David. Late Professor Emeritus, Hebrew University of Jerusalem. Author of *Distribuzioni di terre nell'antica Grecia* (1966), *Leggi greche sul problema dei debiti* (1969), *Fra ellenismo e iranismo* (1983), and *Eradoto: Le storie, Libro I* (1988), *Libro III* (1990). Co-editor of *I Greci* (1996–2000). **Essays:** Arrian, Hieronymus of Cardia, Posidonius.

Aspraki, Gabriella-Evangelia. Freelance researcher. **Essays:** Emigration, Village Society.

Austin, Michel. Senior Lecturer in Ancient History, University of St Andrews. Author of *Greece and Egypt in the Archaic Age* (1970), *Economies et sociétés en Grèce ancienne* (with P. Vidal-Naquet, 1973), and *The Hellenistic World from Alexander to the Roman Conquest* (1981). Contributor to the *Cambridge Ancient History* and to *War and Society in the Greek World*, edited by John Rich and Graham Shipley (1993). **Essays:** Antiochus III, Seleucids.

Avotins, Ivars. Professor of Classical Studies, University of Western

Ontario. Author of *An Index to the Lives of the Sophists of Philostratus* (1978), *Index in Eunapii Vitas Sophistarum* (1983), *On the Greek of the Code of Justinian* (1989), and *On the Greek of the Novels of Justinian* (1992). Contributor to *Classical Quarterly*, *Glotta*, *Hermes*, *Rheinisches Museum*, *Transactions of the American Philological Association*, and *Phoenix*. **Essay:** Herodes Atticus.

Bäbler, Balbina. Freelance researcher. Author of *Fleissige Thrakerinnen und wehrhafte Skythen: Nichtgriechen im klassischen Athen und ihre archäologische Hinterlassenschaft* (1998) and of articles on Herodotus and the Zeus of Phidias. Contributor to *Der Neue Pauly* and *Bryn Mawr Classical Review*. **Essays:** Acragas, Chersonese, Chersonesus, Dyrachium, Healing Cults, Metics, Olbia, Pausanias, Phidias, Slavery.

Barber, Robin L.N. Honorary Fellow, Department of Classics, University of Edinburgh. Author of *The Cyclades in the Bronze Age* (1987), the Blue Guides to *Greece* (1989), *Rhodes and the Dodecanese* (1997), and *Athens* (1999), and articles on Greek art and archaeology. **Essays:** Altars, Cyclades, Dodecanese, Megara, Obsidian, Pottery, Sanctuaries, Santorini, Votive Offerings.

Bastéa, Eleni. Visiting Associate Professor, Comparative Literature, Washington University, St Louis. Author of *The Creation of Modern Athens: Planning the Myth* (2000). Contributor to *Cities: Critical Perspectives on Public Space*, edited by Zeynep Celik et al. (1994) and *Greek Society in the Making, 1863–1913: Realities, Symbols, Visions*, edited by Philip Carabott (1997). Member of the editorial board, *Journal of Architectural Education*. **Essays:** Architecture (domestic), Architecture (public), Cities, Town Planning.

Beaumont, Lesley A. Lecturer in Classical Archaeology, University of Sydney. Former Assistant Director, British School at Athens. Co-director of the Kato Phana Archaeological Project on Chios. Contributor to *The Sacred and the Feminine in Ancient Greece*, edited by Sue Blundell and Margaret Williamson (1998), and *Children and Material Culture*, edited by J. Sofaer Derevenski (in preparation). Author of articles on the archaeology of Chios and the iconography and social history of the children and childhood in ancient Greece. **Essays:** Chios, Family, Smyrna.

Beck, Hans. Assistant Lecturer at the University of Cologne. Author of *Polis und Koinon: Untersuchungen zur Geschichte und Struktur der griechischen Bundesstaaten im 4. Jahrhundert v. Chr.* (1997). **Essays:** Federal States, Military League.

Blanchette, Scott. Defense Analyst, Global Research Corporation International. Intern to the editor, *Journal of Military History*, and contributor to the *Journal of Southwest Military History*. **Essay:** Bureaucracy.

Boardman, Sir John. Professor Emeritus of Classical Archaeology and Art, Oxford University. Author of *Greeks Overseas* (1964, 1999), *Greek Art* (1964, 1997), *Greek Gems and Finger Rings* (1970, 2000), *Diffusion of Classical Art in Antiquity* (1994), *Persia and the West* (2000), and of several handbooks on Greek vases and sculpture and many other books on Greek archaeology and art.

Borthwick, E. Kerr. Professor Emeritus, University of Edinburgh. Contributor to the *New Grove Dictionary of Music* and to *Classical Review*, *Classical Quarterly*, *Journal of Hellenic Studies*, *American Journal of Philology*, *Classical Philology*, *Hermes*, *Mnemosyne*, *Phoenix*, *Greece and Rome*, and *Music and Letters*. **Essay:** Dance.

Bowman, Steven B. Professor of Judaic Studies, University of Cincinnati. Author of *The Jews of Byzantium, 1204–1453* (1985), “Josephus in Byzantium” in *Josephus, Judaism and Christianity*, edited by Louis H. Feldman and Gohei Hata (1987), and “Yosippon and Jewish Nationalism” in *Proceedings of the American Academy for Jewish Research* (1995). Editor of *Birkenau: The Camp of Death* (with Marco Nahon, 1989) and of *In Iure Veritas: Studies in Canon Law in Memory of Schafer Williams* (1991). Contributor to the *Oxford Dictionary of Byzantium* (1991) and *Encyclopedia of the Holocaust*. Book review editor of *Byzantine Studies/Etudes Byzantines* and of *Journal of the Hellenic Diaspora*. **Essay:** Jews.

Boyd, Michael J. Researcher. Author of *Middle Helladic and Early Mycenaean Mortuary Practices in the Southern and Western Peloponnese*, *British Archaeological Reports* (in preparation). **Essays:** Copais, Phaestus.

Braund, David. Professor of Black Sea and Mediterranean History, University of Exeter. Author of *Rome and the Friendly King* (1984), *The Administration of the Roman Empire* (1988), *Georgia in Antiquity* (1994), and *Ruling Roman Britain* (1996). Member of the editorial board of *Ancient Civilizations from Scythia to Siberia*. **Essays:** Athenaeus, Georgia, Ukraine.

Brosius, Maria. Research Associate, Centre for the Study of Ancient Documents, Oxford. Author of *Women in Ancient Persia, 559–331^{BC}* (1996) and *The Persian Empire from Cyrus I to Artaxerxes I* (2000). Co-

editor of *Studies in Persian History: Essays in Memory of David M. Lewis* (1998); editor of *Archives and Archival Traditions: Concepts of Record-Keeping in the Ancient World* (in preparation). **Essays:** Bactria, Parthians, Persian Wars, Persians, Sassanians.

Brown, Christopher G. Chair, Department of Classical Studies, University of Western Ontario. Author of articles on Greek epic, lyric, drama, and religion. Contributor to *A Companion to Greek Lyric Poetry* (1997). **Essays:** Dithyramb, Poetry (Epic, antiquity), Poetry (Lyric, antiquity).

Bryer, Anthony A.M. Emeritus Professor of Byzantine Studies, University of Birmingham. Former Chairman of the British National Committee of the International Byzantine Association, and Convenor of the 21st International Byzantine Congress, Britain (2006). Author of *The Empire of Trebizond and the Pontos* (1980), *The Byzantine Monuments and Topography of the Pontos* (with David Winfield, 1985), *Peoples and Settlement in Anatolia and the Caucasus* (1986), and *The Post-Byzantine Monuments of the Pontos* (2000). **Essays:** Pontus, Trebizond.

Buckler, John. Professor of Greek History, University of Illinois. Author of *The Theban Hegemony, 371–362 BC* (1980), *Philip II and the Sacred War* (1989), and of articles on Greek history of the 4th century BC. Editor, with Hartmut Beister, of *Boiotika: Vorträge vom 5. Internationalen Bötien-Kolloquium zu Ehren von Professor Dr Siegfried Lauffer* (1989). Contributor to *American Historical Association's Guide to Historical Literature* (1995) and *The Oxford Classical Dictionary* (3rd edition 1996). **Essays:** Agesilaus II, Boeotia, Epaminondas, Marathon, Philip II, Thebes.

Buckton, David. Fellow of the Courtauld Institute of Art, University of London; Leverhulme Emeritus Fellow. Former Curator of Early Christian and Byzantine Antiquities, British Museum. Author of *Catalogue of the Medieval Enamels in the British Museum, I: Byzantine and Early Medieval Western Enamel* (in preparation) and of articles on Byzantine enamels. Editor of *The Treasury of San Marco, Venice* (1984), *Studies in Medieval Art and Architecture, Presented to Peter Lasko* (with T.A. Heslop, 1994), and *Byzantium: Treasures of Byzantine Art and Culture* (1994). **Essay:** Enamel.

Budin, Stephanie Lynn. Graduate Student, University of Pennsylvania. Author of articles on gender and sexuality in the ancient Greek world. **Essays:** Gender, Women.

Carras, Costa. Vice-Chairman of Europa Nostra (Confederation of European Conservation Organizations). Author of *3000 Years of Greek Identity: Myth or Reality?* (1983) and of articles on the relation between Christian doctrine and the secular world. Co-editor of *Living Orthodoxy* (1996). Contributor to *Democracy and Civil Society in the Balkans* (1996). **Essay:** Identity.

Carson, Jeffrey. Professor of Literature and of Art History, Aegean Center for the Fine Arts. Author or editor of *Six and One Remorses for the Sky* (1972), *Paros* (with James Clark, 1977), *49 Scholia on the Poems of Odysseus Elytis* (1983), *The Temple and the Dolphin* (1995), *The Collected Poems of Odysseus Elytis* (1997), and *Poems 1974–1996* (1997). **Essays:** Menander, Scopas.

Champion, Craige. Assistant Professor of History and Classical Languages, Allegheny College. Contributor to *Phoenix*, *American Journal of Philology*, *Historia*, *Transactions of the American Philological Association*, and *Bryn Mawr Classical Review*. **Essay:** Aetolia.

Cheal, Catheryn, L. Adjunct Professor, California State University, Northridge. Author of articles on Hellenistic clay sculptures and the coins of Selinus. Contributor to *Classical World*. **Essays:** Furniture, Silk.

Christesen, Paul. Assistant Professor of Classics, Dartmouth College, New Hampshire. **Essays:** Finance, Taxation, Transhumance.

Clay, Diskin. Professor of Classical Studies, Duke University. Author of *Lucretius and Epicurus* (1983), *Lucian of Samosata: Four Philosophical Lives* (1992), and *The Philosophical Inscription of Diogenes of Oenoanda* (1990), *Paradosis and Survival: Three Chapters in the History of Epicurean Philosophy* (1998), *Four Island Utopias* (with Andrea Purvis, 1999), and *Platonic Questions: Dialogues with the Silent Philosopher* (2000). Translator of *Philodemus: On Frank Criticism* (1988). Editor of the *American Journal of Philology*. **Essay:** Heroes and Heroines.

Conley, Thomas M. Professor of Speech Communication, University of Illinois, Urbana. Author of *Rhetoric in the European Tradition* (1990), *Byzantine Culture in Renaissance and Baroque Poland* (1994), “Byzantine Literary Criticism and the Uses of Literature” in *The Cambridge History of Literary Criticism*, vol. 2, edited by A. Minnis (in preparation), and an article on Aristotle’s *Rhetoric* in Byzantium. **Essays:** Aristotelianism, Rhetoric, Second Sophistic, Sophists.

Conomos, Dimitri. Visiting Professor, Royal Holloway and Bedford

New College, University of London. Director of Studies, Academy of Theological Studies, Volos, Greece. Author and editor of publications for Syndesmos (the World Fellowship of Orthodox Youth) and the World Council of Churches.

Crowther, Nigel B. Associate Professor of Classical Studies, University of Western Ontario. Contributor to *Classical Quarterly*, *Greece and Rome*, *Phoenix*, *Nikephoros*, *American Journal of Philology*, *Mnemosyne*, *Eranos*, *Journal of Hellenic Studies*, and *Classical Philology*. **Essay:** Olympia.

da Costa, Virginia M. Assistant Professor of Art History, West Chester University, Pennsylvania. Author of articles on Renaissance portrait medals and Roman relief carvings and coins. Editor and curator of *Mothers, Maidens, Sirens and Slaves: Images of Women in the Ancient World* (1996). **Essays:** Painting (antiquity), Portraiture, Purple.

Dalby, Andrew. Author of *Siren Feasts: A History of Food and Gastronomy in Greece* (1996) and of *Empire of Pleasures: Luxury and Indulgence in the Roman World* (2000). Editor and translator of *Cato: On Farming* (1998). **Essays:** Fairs and Markets, Food and Drink, Libraries, Oral Tradition, Symposium.

De Chaves-Chronopoulos, Lila. Ethnologist, Curator of the Jewellery workshop, Benaki Museum, and Consultant of ELKA (the Greek National Goldsmiths Centre). Author of *Greek Jewellery in Space and Time: History of the Art and Craft* (1994), and of articles on Coptic textiles, lace, and traditional costumes. Editor of *Friends of the Benaki Museum Bulletin*. Vice-President, UNESCO International Committee for the Preservation and Promotion of Folk Art and Culture. **Essay:** Metalwork.

Dickey, Eleanor. Assistant Professor of Greek, Columbia University. Author of *Commentary on Selected Odes of Pindar* (1991) and *Greek Forms of Address: From Herodotus to Lucian* (1996). Contributor to *Mnemosyne*, *Classical Quarterly*, *Language in Society*, and *Journal of Linguistics*. **Essays:** Homer, Josephus, Language, Lucian, Satyr Play.

Dijk, Gert-Jan van. Professor of Greek, Catholic University of Nijmegen and Amsterdam Free University. Author of “De theorie van de fabel in de Griekse Oudheid” in *Mijn naam is haas: Dierenverhalen in verschillende culturen*, edited by W.L. Idema, M. Schipper, and P.H. Schrijvers (1993), “Greek Fable Theory after Aristotle: Characters and Characteristics” in *Greek Literary Theory after Aristotle: A Collection of Papers in Honour of D.M. Schenkeveld*, edited by J.G.J. Abbenes, S.R.

Slings, and I. Sluiter (1995), and Ainoi, Logoi, Muthoi: *Fables in Archaic, Classical, and Hellenistic Greek Literature* (1997). Contributor to *Mnemosyne. Essays*: Aesop, Babrius, Fable.

Dillery, John. Associate Professor of Classics, University of Virginia. Author of *Xenophon and the History of His Times* (1995). Editor of the 1998 Loeb edition of Xenophon's *Anabasis*. Contributor to *Classical Philology*, *Historia*, *Classical Quarterly*, *Zeitschrift für Papyrologie und Epigraphik*, and *American Journal of Philology*. **Essays**: Isocrates, Theopompus, Xenophon.

Dover, Sir Kenneth. Chancellor of St Andrews University. Author of *Greek Word Order* (1960), *Lysias and the Corpus Lysiacum* (1968), *Greek Popular Morality in the Time of Plato and Aristotle* (1974), *Greek Homosexuality* (1978), *Greek and the Greeks* (1987), *The Greeks and Their Legacy* (1988), *Marginal Comment* (1994), and *The Evolution of Greek Prose Style* (1997). Co-author of *Historical Commentary on Thucydides*, vols 4 and 5 (1970 and 1980) and *Ancient Greek Literature* (1980). Editor of *Clouds* (1968) and *Frogs* (1993) by Aristophanes, *Select Poems* by Theocritus (1971), and *Perceptions of the Ancient Greeks* (1992). **Essays**: Aristophanes, Lysias, Thucydides.

Drosos, Fr Nektarios. Priest. Author of book on hagiography and articles on Thessalian history. **Essay**: Olympus.

Edwards, Mark. University Lecturer in Patristics, Oxford University. Co-author of *Portraits: Biographical Representation in the Greek and Latin Literature of the Roman Empire* (with S. Swain, 1997). Editor and translator of *Philoponus: Commentary on Aristotle, Physics III* (1994) and *Optatus: Against the Donatists* (1997). Contributor to the *Journal of Theological Studies*. **Essays**: Alchemy, Carneades, Cynics, Origen, Paul.

Edwards, Michael J. Senior Lecturer in Classics, School of English and Drama, Queen Mary and Westfield College, University of London. Author of *Companion to Plutarch, Lives of Pompey, Caesar and Cicero* (1991), and *The Attic Orators* (1994). Editor of *Greek Orators*, vol. I: *Antiphon and Lysias* (with S. Usher, 1985), *Greek Orators*, vol. 4: *Andocides* (1995), and *Lysias: Five Speeches* (1999). **Essays**: Aeschines, Demosthenes, Judicial Procedures, Magistrates, Ostracism, Political History 490–323 BC.

Erskine, Andrew. Senior Lecturer, Department of Classics, University College, Dublin. Author of *Hellenistic Stoa: Political Thought and Action* (1990) and *Troy between Greece and Rome: Local Tradition and Imperial Power* (in preparation). **Essay**: Polybius.

Evans, J.D.G. Professor of Logic and Metaphysics, Queen's University of Belfast. Author of *Aristotle's Concept of Dialectic* (1977), *Aristotle* (1987), and *Moral Philosophy and Contemporary Problems* (1987). Contributor to the *Cambridge Philological Society*, *Journal of Hellenic Studies*, *Classical Review*, *Aristotelian Society Proceedings*, and *Philosophical Quarterly*. **Essays:** Dialectic, Parmenides.

Evans, James Allan. Professor Emeritus, University of British Columbia. Author of *A Social and Economic History of an Egyptian Temple in Greco-Roman Egypt* (1961), *Procopius* (1972), *Herodotus* (1981), *Herodotus, Explorer of the Past: Three Essays* (1991), *The Age of Justinian: The Circumstances of Imperial Power* (1996), and a book on the empress Theodora (in preparation). **Essays:** Leonidas, Magna Graecia, Sicily, Syracuse.

Evely, Don. Freelance research archaeologist. Author of *Minoan Crafts: Tools and Techniques* (1993). Co-editor of *Knossos: A Labyrinth of History* (1994) and *Minotaur and Centaur* (1996). **Essays:** Knossos, Minoans.

Fernandes, Eugénie. Lecturer at the University of Liverpool and Member of King's College, Cambridge. **Essays:** Adultery, Antiquity, Children, Disease, Divorce, Dowry, Marriage, Prostitution, Spells.

Fiedler, Barbara. Lecturer in Classics, George Washington University. Author of "Ritual Innovation and Political Change in Iron Age Greece" in *Papers of the World Archaeological Congress, Southampton* (1986). **Essays:** Canals, Land Tenure, Water Management.

Fleming, K.E. Assistant Professor of History and Hellenic Studies, New York University. Author of *The Muslim Bonaparte: Diplomacy and Orientalism in Ali Pasha's Greece* (1999) and of articles on Turkish and Greek history. Book editor, *Southeast European Monitor*. **Essay:** Ioannina.

Foley, Anne. Associate Professor, Classics Department, Queen's University, Kingston, Ontario. Author of *Argos and the Argolid, 800–600 BC : An Archaeological Survey* (1988), "Idle Speculation about Argos? Some Thoughts on the Present State of Eighth and Seventh Century Argive Studies" in *Klados: Essays in Honour of Professor J.N. Coldstream, BICS*, edited by C. Morris and A. Peatfield (1995), "Ethnicity and the Topography of Burials in the Geometric Period", *Argos et l'Argolide: Topographie et urbanisme*, edited by A. Pariente and G. Touchais (1998), and "Pheidon of Argos: A Reassessment" in *Argolo-Korinthiaka I*, edited by J. Fossey and P.J. Smith (1999).
